The issue of shorter health claims has been discussed in detail in the preamble to the final rule on general requirements for health claims published elsewhere in this issue of the **Federal Register**. As noted in comment 15 of this document, FDA has dropped the phrase "in some but not all." Additionally, FDA is making reference to the blood cholesterol linkage between dietary saturated fat and cholesterol and risk of heart disease optional. FDA reasons that this amount of detail is not necessary to motivate consumers to implement recommended dietary changes and contributes to wordiness. Thus, the minimum requirements can now be met with a statement as simple as "While many factors affect heart disease, diets low in saturated fat and cholesterol may reduce the risk of this disease." Additional provisions that were included in the proposed rule have been deleted or made optional to simplify health claims. Other model health claims are provided in new § 101.75(e). As discussed earlier in this preamble, FDA does, however, believe it is important for each model health claim to acknowledge that many factors affect heart disease.

Other changes incorporated into the final regulation include reorganization of paragraphs and clarification of requirements. The final regulation requires claims to use the word "may" or "might" rather than "can" or other words when describing the possible effect of a diet low in fat and cholesterol on risk of heart disease (§ 101.75(c)(2)(i)(A)). Although FDA recognizes that it cannot require preclearance of claims, it considers this and other restrictions on word choices to be necessary so that claims will accurately reflect the state of the science. All changes in the final regulation are a logical outgrowth of the proposal.

24. A few comments suggested that the agency amend the language of the health claim to include "very-low fat, low-cholesterol diets begin to reverse CHD in some patients." Accompanying the comments were six scientific publications describing six clinical trials. The comments thus suggested tighter criteria for the qualifying levels of fat and cholesterol, e.g., "very low," and a replacement of "may reduce the risk of" with a stronger statement about a "reversal" of CHD. In addition, the suggested claim would target one segment of the general population which is at increased risk for heart disease. The comments submitted a number of publications to justify use of the term "reversal" of heart disease.

FDA does not agree that the submitted publications justify the statement that heart disease may be reversed by very low fat, low saturated fat, and low cholesterol diets. Three of the randomized, controlled trials were previously reviewed (in Table 2 of the proposal) by the agency (56 FR 60727 at 60754 through 60755 and 60763) (Refs. 12, 14, and 106). The fourth was conducted in 1984 (Ref. 197) and therefore evaluated by Government and other public health authoritative reports, and the two remaining studies did not provide adequate information to be able to attribute beneficial results to specific dietary components (Refs. 198 and 199). Thus, while FDA finds these results very interesting and considers the studies to suggest a decrease in progression of heart disease from the combination of medical interventions used in these studies, FDA has concluded that these results are not applicable to health claims for several reasons. First, the treatment modality used to obtain results was primarily drugs that lower both blood lipids and blood pressure, in combination with dietary changes. Secondly, the treatment changes were quite severe, and their implementation in the general population is unlikely to be a reasonable goal. Finally, subjects were persons with serious preexisting CHD and under close medical supervision.

25. An association of medical professionals provided a number of references that suggest serum cholesterol goals for patients with noninsulin-dependent diabetes mellitus and patients with hyperlipidemia. The comment asked that the health claim be required to specifically identify and target this group of individuals as high-risk populations.

FDA disagrees that specific dietary advice and goals for persons with diseases such as noninsulin-dependent diabetes mellitus and hyperlipidemia should be required to be included as part of health claim messages. These are serious health conditions and require medical supervision. Health claims are intended for the general population. Foods bearing claims for conditions requiring medical supervision are more appropriately regulated as foods for special dietary use, as medical foods, or as drugs, depending upon the specifics of the food and the claims made for it.

VII. Consumer Summary

FDA also proposed to make available consumer summaries to provide additional information on the health claim. Comments from consumers, health care professionals, public health associations, and the food industry supported the use and availability of consumer summaries. FDA did not receive any comments that did not support the use of consumer summaries for this health claim regulation. Comments were received, however, for other health claim regulations suggesting that there was no need for consumer summaries.

As discussed in the final rule on general requirements for health claims published elsewhere in this issue of the **Federal Register**, consumer summaries are not required, although their use remains an option. For this reason, the proposed consumer summary has not been included in this final rule.

VIII. Summary of Updated Science Review

To ensure that significant new evidence had not become available subsequent to the proposal, FDA updated its review of the scientific evidence with human studies that were directly relevant to the proposed rule or that became available after publication of its proposal (Table).

A. Relationship of Dietary Saturated Fat and Cholesterol to Blood Cholesterol and, Therefore, to Risk of Heart Disease.

1. Saturated Fat

In the proposed rule (56 FR 60727 at 60728), FDA accepted the conclusions of consensus documents that serum cholesterol levels are a valid intermediate predictor of risk of heart disease (Refs. 20, 29 through 36, 74, 136, 150, and 151). FDA limited its evaluation of the nutrient/disease relationship to diets low in saturated fat and cholesterol and reduced risk of CHD. FDA additionally proposed that health claims should be prohibited on foods that are not low in fat because of strong indirect links between high fat diets and risk of heart disease.

A recent study supports the applicability of dietary modifications to children. A longitudinal study in 108 healthy Hispanic preschool children (Ref. 183) compared children in the highest tertile (a tertile is a comparison based on thirds, i.e., highest, middle and lowest tertile) of total fat and saturated fat consumption (36.2 percent and 14.6 percent of calories as fat and saturated fat, respectively) to children in the lowest tertile (30 percent and 11 percent of calories as fat and saturated fat). Higher total fat and saturated fat intakes were associated with higher blood total and LDL- cholesterol levels (Table).

Several new clinical trials provide additional support that reductions in intakes of dietary saturated fat and cholesterol reduce serum total and LDL-cholesterol levels, even though serum triglyceride and HDL-cholesterol levels do not change significantly.

Deneke et al. (Ref. 162) compared the effects on blood cholesterol levels in 10 men, mean age 66, (Table) of isocaloric, liquid diets differing in type and amount of SFA. In the self controlled, cross-over study, the saturated fat was derived from either butter (25 percent SFA), beef (18 percent SFA), cocoa butter (23 percent SFA) or olive oil (8 percent SFA). These fat diets also differed in the amount of stearic acid: 4, 7.6, 13 and 1.2 percent, respectively. Diets enriched in saturated fat from butter, beef, or cocoa butter, significantly increased total cholesterol and LDL-cholesterol compared to diets containing less saturated fat. The higher concentration of stearic acid in both beef and cocoa butter diets did not negate the effect of saturated fat on blood cholesterol levels. Under the conditions of the study design, stearic acid was neutral in its ability to change blood cholesterol levels. This study should be repeated using more subjects, including healthy subjects, and with solid foods to provide nutritional data that is more applicable to the general public.

In another dietary intervention study, the effects of a low fat, low saturated fat, no cholesterol diet on serum cholesterol was reported (Ref. 184). Five familial hypercholesterolemic (FH) patients and four healthy control individuals consumed a diet that was very low fat (8.2 percent of calories), and high carbohydrate (90.5 percent of calories) for 1 month, following 1 month on a basal diet, and after 3 months on a wash-out diet (see Table). Both normal controls and FH patients responded similarly, with a significant decrease in total and LDL-cholesterol. HDL-cholesterol decreased nonsignificantly, but serum triglycerides increased significantly. One difference in response by FH patients and controls to the diets was observed in cholesterol synthesis. Cholesterol synthesis fell 24 percent (8.4 to 6.4 mg/kg/day) in controls and 58 percent (11.4 to 4.8 mg/kg/day) in FH patients.

Another dietary intervention study compared the effects of diets supplemented with saturated fat or linoleic acid on blood cholesterol levels (Ref. 180). This study of free-living subjects was conducted in 12 mildly hypercholesterolemic individuals (5 men and 7 women) ages 27 to 74 years, in a randomized, cross-over design that provided 2 weeks on the basal diet and 3 weeks on each of the test diets. Total fat composition of the diets is shown in the Table. The test diets contained an additional 17.3 percent SFA or 14.8 percent of PUFA (in the form of linoleic acid). The saturated fat-enriched diet significantly increased total cholesterol and LDL-cholesterol compared to the baseline diet. The linoleic-supplemented diet, which has a similar concentration of saturated fat as the basal diet, produced significantly lowered total cholesterol, 19 mg/decaliter (dL) (0.5 millimoles/Liter (mmol/L)) less compared to the basal diet and 39 mg/dL (1.0 mmol/L) less compared to the saturated fat-enriched diet. This study should be repeated using more subjects including healthy subjects and with solid foods to provide nutritional data that are more applicable to the general public. The study does suggest the possibility of more flexibility in dietary options available for the general public.

The effect of a "Western" diet rich in saturated fat and cholesterol (total fat, saturated fat and cholesterol: 43 percent, 21 percent, of calories, 1,020 mg/day, respectively) on blood cholesterol levels was measured in free-living subjects who normally consume a low fat, low saturated fat, Tarahumara diet (less than 20 percent of calories from total fat, 7 percent from saturated fat and less than 50 mg/day) (Ref. 176). The study included 12 adults (5 women) and one 12-year-old boy. After consumption of the "Western" diet for 5 weeks, total cholesterol, LDL-cholesterol, HDL-cholesterol and triglycerides increased significantly in all subjects. Total cholesterol increased from 121 mg/dL at baseline to 159 mg/dL, and LDL-cholesterol went from 72 to 100 mg/dL. The "Western" diet as described by the study design contains a higher level of total fat, saturated fat, and cholesterol than consumed by the U.S. general population.

2. Dietary Cholesterol

In another recent study, the effect of dietary cholesterol (in the form of eggs) on serum cholesterol levels was measured in seventy 18 to 19 year old, free-living, healthy males (Ref. 190). A baseline diet containing 3 eggs per week was consumed by all subjects for 3 months (diet composition contained in the Table: total fat was 40 percent of approximately 3,350 calories per day). The subjects were divided into three groups of approximately equal numbers:

one group continued on the baseline diet, group 2 was supplemented with 7 eggs per week, and the third group was supplemented with 14 eggs per week for an additional 5 months. No significant differences were reported in total cholesterol, LDL-cholesterol, or triglycerides between groups.

The authors proposed several suggestions to explain these results. They stated that the relatively high levels of total fat compounded with a low content PUFA compared to SFA content may have canceled the potential serum cholesterol-raising effects of dietary cholesterol. Secondly, they suggested that the subjects may have adapted to the diet by decreasing cholesterol synthesis or by increasing the rate of cholesterol eliminated from the body.

Meta-analysis was used to examine the effects of dietary cholesterol on serum cholesterol from 76 studies that had reported completely controlled diets (Ref. 221). This meta-analysis, unlike previously reported studies, included baseline together with added dietary cholesterol data, PUFA and SFA content of the diet, and weighted the number of subjects in each trial. The diets used in the trials included formula diets, semipurified diets, and diets based on customary food. The baseline dietary cholesterol was a statistically stronger predictor of change in blood cholesterol than added dietary cholesterol. Thus when baseline dietary cholesterol was high, added dietary cholesterol resulted in diminished increases in total blood cholesterol. Therefore, when one to two eggs are added to a diet that already contain 350 to 400 mg/day of cholesterol, little increase in blood cholesterol would be expected.

B. Estimates of Change in Blood Cholesterol by Following Low Fat, Saturated Fat and Cholesterol Dietary Guidelines

In the following group of studies, the effectiveness of diets reduced in total fat, SFA, and cholesterol to levels suggested by national nutritional guidelines and health organizations were evaluated.

A diet referred to as "US74" (fat content was 38 percent of total calories, SFA 18 percent, MUFA's 14 percent, PUFA 4 percent, and cholesterol 600 mg/day) (Table, Ref. 168) was compared to the diet recommended by U.S. public health authorities (fat 30 percent and SFA, MUFA, and PUFA 10 percent of total calories, respectively, and cholesterol 300 mg/day and referred to as modified diet ("MOD" diet)) on total blood cholesterol levels. The study included 5 free-living women of Chinese origin and 14 of Caucasian origin, in a cross-over, randomized order design with each test diet lasting 3 weeks. Throughout the intervention study, the Chinese women had consistently higher total cholesterol, LDL-cholesterol, HDL-cholesterol and triglyceride levels than Caucasians, regardless of diet selected. Caucasian women showed a significant decrease in total cholesterol and LDL-cholesterol only when the US74 diet was compared to the MOD diet. Consumption of the US74 diet increased total cholesterol and very-low density lipoprotein-cholesterol (VLDL-cholesterol) in Chinese women compared to a self selected diet (in which fat was 34 percent of total calories and SFA was about 12 percent, MUFA was 13 percent (based on g of oleic acid/day), PUFA was 8 percent (based on g of linoleic acid/day), and cholesterol was 360 mg/day).

The second study evaluated the effectiveness of the American Heart Association (AHA) Step-1 diet in lowering blood cholesterol in free-living subjects (Ref. 154). (The AHA Step-1 diet contains 10 percent or less saturated fat; 30 percent or less of total calories from fat; and less than 300 mg/day cholesterol.) Forty-nine men and 38 women completed the 18 week dietitian-instructed study (they were hypercholesterolemic, total cholesterol 243 mg/dL. and LDL-cholesterol 169 mg/dL; and mean age of 50 years, Table). Modest, but significant, decreases were observed in total-cholesterol and LDL-cholesterol after 6 weeks. No further reductions in total- or LDL-cholesterol were observed at 12 or 18 weeks, and there was a tendency to return to or exceed baseline cholesterol levels. The authors suggested that since most of the participants knew they were hypercholesterolemic before the study, they may have already been following a self-developed, low saturated fat, low fat, low cholesterol diet. This conclusion was derived from analysis of self-administered food frequency questionnaires and 4-day food records, including 1 weekend day collected on baseline diet and AHA Step-1 diets.

The third study compared the effectiveness of the AHA Step-3 diet with a typical American diet. It pointed out additional considerations in implementing dietary changes to reduce blood cholesterol and CHD risk in women. In the study, 19 free-living premenopausal women consumed a typical American diet for 28 days prior to 5 months of the AHA Step-3 diet (Table, Ref. 161). In brief, self-reported dietary fat, saturated fat, and cholesterol for the American versus AHA Step-3 diet was 37 percent versus 21 percent; 15.7 percent versus 4.7 percent; and 271 versus 96 mg/day, respectively. Total cholesterol, LDL-cholesterol, and HDL-cholesterol decreased in these women consuming the AHA Step-3 diet. However, only after subdividing the women by body mass index were there significant decreases in total cholesterol, LDL-cholesterol, and HDL-cholesterol. Lean women, as determined by body mass index, had significant decreases in blood cholesterol, while moderate or grossly obese women did not. The authors suggest that results from this study with free-living individuals may imply that obese women may be more sensitive to dietary carbohydrates and therefore not as responsive to a diet low in total fat, saturated fat, and cholesterol and enriched in carbohydrate (43.8 versus 59.4 percent). Secondly, alternative diets that replace SFA by means other than carbohydrate exchange may be more effective in these individuals.

In a fourth study, the effectiveness of intensive dietary instruction on reduction of serum cholesterol level was evaluated as part of the Heart Tune Program (Ref. 169). Hypercholesterolemic patients (30 women and 19 men) attended 4 consecutive classes on heart disease, properties and definitions of fat, healthy food selections, and meal preparations for 2 1/2 hours per week. At baseline, the total and LDL-cholesterol levels of participants in the study were 268 mg/dL (6.95 mmol/L) and 180 mg/dL (4.68 mmol/L), respectively. After 4 weeks of enrollment in the program, there was a significant reduction in both total cholesterol and LDL-cholesterol to 240 mg/dL (6.30 mmol/L) and 161 mg/dL (4.16 mmol/L), respectively.

Additional confirmation and estimation of benefits associated with a reduction in serum cholesterol levels that are predictive of heart disease was provided using a computer model (Ref. 170). Subjects for the computer model system included both men and women with blood cholesterol levels ranging from 200 mg/dl (5.2 mol/L) to 300 mg/dL (7.8 mmol/L) at baseline. Data for the study incorporated updated estimates from both America (Framingham Heart Study) and Canada (Canadian Health Survey). Results suggested that, by reducing serum cholesterol levels by 5 to 33 percent, life expectancy could be lengthened by 0.03 to 3.16 years.

In summary, the updated literature review was consistent with and generally supported the tentative conclusions reached in the proposed rule (56 FR 60727 at 60735). That is,

diets low in saturated fat and cholesterol reduce blood cholesterol levels, particularly LDL-cholesterol levels.

C. Safety Issues

1. Trans-fatty Acids

One area identified in the proposed rule as a potential concern was the possibility of increased intake of *trans*-fatty acids as a result of changes in the fat composition of the U.S. food supply. One study that has been widely cited within the scientific community is the study by Mensink and Katan (Ref. 95).

Studies that examined the effects of *trans*-fatty acids on serum cholesterol levels are limited and report conflicting results and conclusions. One *trans*-fatty acid study discussed and evaluated in Table 2 of the proposed rule (56 FR 60727 at 60761, Ref. 95), reported that consumption of a diet enriched in *trans*-fatty acids (11 percent of total calories or 33 g/day) significantly increased total cholesterol and LDL-cholesterol and significantly reduced HDL-cholesterol levels in healthy subjects. The level of *trans*-fatty acids used was much higher than the level reported available for consumption by the U.S. population (3 to 4 percent of calories or 7 to 10 g/day).

In a recent study by Zock and Katan (Ref. 193), healthy, free-living, normolipidemic individuals (26 males and 30 females) consumed diets that compared the effect of C–18 fatty acids (saturated, trans-monoene, and unsaturated form) on serum lipids. Each diet, which did not differ in nutrient content, lasted for 3 weeks and was eaten as solid foods. In this multiple, cross-over design study, the *trans*-fatty acid level was set at 7.7 percent of total calories or 24 g/day. Both stearate and *trans*-fatty acid-enriched diets increased total cholesterol and LDL-cholesterol levels significantly, relative to the linoleate diet (a polyunsaturated fat). In addition, both stearate and *trans*-fatty acids significantly reduced HDL-cholesterol relative to linoleate. Lower HDL-cholesterol levels were observed in 46 of 56 subjects on the *trans*-fatty acid enriched diet. The authors concluded that, if the data from this study are combined with those from the previous study (Refs. 95 and 193), the results suggested that for every 1 percent of energy derived from *trans*-fatty acids, LDL-cholesterol would increase by 1.2 mg/dL and HDL-cholesterol would be lowered by 0.6 mg/dL relative to an equivalent amount of oleic or linoleate. The authors concluded that the current U.S. *trans*-fatty acid consumption level of about 3 to 4 percent of total calories may increase LDL-cholesterol by 4 mg/dL and decrease of HDL-cholesterol by 2 mg/dL.

2. Unsaturated Fatty Acids

In the following group of studies, the effect of diets reduced in total fat, SFA, and cholesterol to levels suggested by national nutritional guidelines and health organizations was evaluated with respect to the possibility of increased intake of unsaturated fatty acids, especially PUFA's. This issue was raised in the proposal as a result of possible changes in the fat composition of the U.S. food supply (56 FR 60727 at 60735).

In a randomized, blinded, controlled dietary intervention study, the effect of diets enriched in vegetable oils on serum cholesterol levels in 31 free-living mildly hypercholesterolemic men (Ref. 192) was reported. Two conditions were examined: Test diets, in which the saturated fat content was 7 percent (test) versus 15 percent in the control diets, were enriched in either MUFA (22 percent MUFA-test versus 14 percent-control) or PUFA (22 percent PUFA-test versus 9 percent PUFA-control) (refer to the Table). Total and LDL-cholesterol levels were reduced significantly by consumption of diets reduced in saturated fat and enriched (22 percent of calories) in either MUFA or PUFA (total cholesterol: -15 (PUFA) and -12 (MUFA) percent, and LDL-cholesterol: -20 (PUFA) and -12 (MUFA) percent, respectively).

3. PUFA-Enriched Diets Versus MUFA-Enriched Diets

A recent study by Mata et al. (Ref. 175) compared the long-term effects of PUFA-enriched diets versus MUFA-enriched diets, on blood cholesterol levels in 46 free-living, healthy men (mean age 33 years) and 32 women (mean age 42). The two diets were similar in all respects other than the content of the test unsaturated fatty acids (the PUFA-enriched diet content contained total fat 37 percent; SFA 12.5 percent; PUFA 13 percent; and MUFA 10 percent; while the MUFA-enriched diet had the same amount of total and saturated fat but 3.4 percent PUFA and 20 percent MUFA) (see Table). This controlled, solid food study, was conducted in two phases: phase 1, PUFA-enriched diets (for 16 weeks) followed by a second phase, the MUFA-enriched diet, which lasted for 28 weeks. The MUFA-enriched diet had no effect on blood total cholesterol in men but increased it in women. The MUFA-enriched diet increased HDL-cholesterol levels compared to the PUFA-enriched diet. HDL-cholesterol levels increased in both men (17 percent) and women (30 percent). No significant changes occurred in LDL-cholesterol or total triglycerides.

In summary, the updated literature review reveals relatively few new studies pertaining to possible unintended safety effects from reducing dietary intakes of saturated fat and cholesterol. Possible adverse effects on LDL-cholesterol and HDL-cholesterol from the consumption of large quantities of *trans*-fatty acids are supported by recent scientific reports. Most results are consistent with those of earlier reviews (Refs. 20, 30 through 36, 136, 150, and 151) and with comments received in response to the proposed rule.

Overall, the updated literature review provided no convincing evidence to suggest that the agency's tentative conclusions as to the relationship of saturated fat and cholesterol to risk of heart disease, as described in the proposal, required modification.

IX. Conclusions

FDA has responded to all comments received in response to the proposed saturated fat and cholesterol and CHD health claim regulation. In addition, the agency has reviewed all additional scientific studies received in comments or independently identified. The agency has determined that the new studies strengthen the tentative conclusions reached in the proposed regulation. After considering the comments and the new scientific studies, the agency concludes that there is significant scientific agreement based on the totality of publicly available scientific evidence that a claim that diets low in saturated fat and cholesterol may reduce the risk of CHD is supported by that evidence. Therefore, FDA is authorizing a claim.

The agency has decided that the regulations for the authorized health claims are most useful if they follow a consistent format and require only information that the agency considers essential. Therefore, the agency has made a number of editorial changes in the proposed codified material of the saturated fat and cholesterol and CHD health claim to make it more consistent with other authorized claims.

X. Environmental Impact

The agency has determined under 21 CFR 25.24(a)(11) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

XI. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the Federal Register of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the Federal Register. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the Federal Register announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

List of Subjects in 21 CFR Part 101

Food Labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 101 is amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. New § 101.75 is added to subpart E to read as follows:

§ 101.75 Health claims: dietary saturated fat and cholesterol and risk of coronary heart disease.

(a) *Relationship between dietary saturated fat and cholesterol and risk of coronary heart disease.* (1) Cardiovascular disease means diseases of the heart and circulatory system. Coronary heart disease is the most common and serious form of cardiovascular disease and refers to diseases of the heart muscle and supporting blood vessels. High blood total- and low density lipoprotein (LDL)- cholesterol levels are major modifiable risk factors in the development of coronary heart disease. High coronary heart disease rates occur among people with high blood cholesterol levels of 240 milligrams/deciliter (mg/dL) (6.21 millimoles per liter (mmol/L)) or above and LDL-cholesterol levels of 160 mg/dL (4.13 mmol/L) or above. Borderline high risk blood cholesterol levels range from 200 to 239 mg/dL (5.17 to 6.18 mmol/L) and 130 to 159 mg/dL (3.36 to 4.11 mmol/L) of LDL-cholesterol. Dietary lipids (fats) include fatty acids and cholesterol. Total fat, commonly referred to as fat, is composed of saturated fat (fatty acids containing no double bonds), and monounsaturated and polyunsaturated fat (fatty acids containing one or more double bonds).

(2) The scientific evidence establishes that diets high in saturated fat and cholesterol are associated with increased levels of blood total- and LDL-cholesterol and, thus, with increased risk of coronary heart disease. Diets low in saturated fat and cholesterol are associated with decreased levels of blood total- and LDL-cholesterol, and thus, with decreased risk of developing coronary heart disease.

(b) *Significance of the relationship between dietary saturated fat and cholesterol and risk of coronary heart disease.* (1) Coronary heart disease is a major public health concern in the United States, primarily because it accounts for more deaths than any other disease or group of diseases. Early management of risk factors for coronary heart disease is a major public health goal that can assist in reducing risk of coronary heart disease. There is a continuum of mortality risk from coronary heart disease that increases with increasing levels of blood LDL-cholesterol. Individuals with high blood LDL-cholesterol are at greatest risk. A larger number of individuals with more moderately elevated cholesterol also have increased risk of coronary events;

such individuals comprise a substantial proportion of the adult U.S. population. The scientific evidence indicates that reducing saturated fat and cholesterol intakes lowers blood LDL-cholesterol and risk of heart disease in most individuals. There is also evidence that reducing saturated fat and cholesterol intakes in persons with blood cholesterol levels in the normal range also reduces risk of heart disease.

(2) Other risk factors for coronary heart disease include a family history of heart disease, high blood pressure, diabetes, cigarette smoking, obesity (body weight 30 percent greater than ideal body weight), and lack of regular physical exercise.

(3) Intakes of saturated fat exceed recommended levels in many people in the United States. Intakes of cholesterol are, on average, at or above recommended levels. One of the major public health recommendations relative to coronary heart disease risk is to consume less than 10 percent of calories from saturated fat, and an average of 30 percent or less of total calories from all fat. Recommended daily cholesterol intakes are 300 mg or less per day.

(c) *Requirements.* (1) All requirements set forth in § 101.14 shall be met.

(2) Specific requirements. (i) *Nature of the claim.* A health claim associating diets low in saturated fat and cholesterol with reduced risk of coronary heart disease may be made on the label or labeling of a food described in paragraph (c)(2)(ii) of this section provided that:

(A) The claim states that diets low in saturated fat and cholesterol "may" or "might" reduce the risk of heart disease;

(B) In specifying the disease, the claim uses the terms "heart disease" or "coronary heart disease;"

(C) In specifying the nutrient, the claim uses the terms "saturated fat" and "cholesterol" and lists both;

(D) The claim does not attribute any degree of risk reduction for coronary heart disease to diets low in dietary saturated fat and cholesterol; and

(E) The claim states that coronary heart disease risk depends on many factors.

(ii) *Nature of the food.* The food shall meet all of the nutrient content requirements of § 101.62 for a "low saturated fat," "low cholesterol," and "low fat" food; except that fish and game meats (i.e., deer, bison, rabbit, quail, wild turkey, geese, and ostrich) may meet the requirements for "extra lean" in § 101.62.

(d) *Optional information.* (1) The claim may identify one or more of the following risk factors in addition to saturated fat and cholesterol about which there is general scientific agreement that they are major risk factors for this disease: A family history of coronary heart disease, elevated blood total and LDL-cholesterol, excess body weight, high blood pressure, cigarette smoking, diabetes, and physical inactivity.

(2) The claim may indicate that the relationship of saturated fat and cholesterol to heart disease is through the intermediate link of "blood cholesterol" or "blood total- and LDL cholesterol."

(3) The claim may include information from paragraphs (a) and (b) of this section, which summarize the relationship between dietary saturated fat and cholesterol and risk of coronary heart disease, and the significance of the relationship.

(4) In specifying the nutrients, the claim may include the term "total fat" in addition to the terms "saturated fat" and "cholesterol".

(5) The claim may include information on the number of people in the United States who have coronary heart disease. The sources of this information shall be identified, and it shall be current information from the National Center for Health Statistics, the National Institutes of Health, or "Nutrition and Your Health: Dietary Guidelines for Americans," U.S. Department of Health and Human Services (DHHS) and U.S. Department of Agriculture (USDA), Government Printing Office.

(6) The claim may indicate that it is consistent with "Nutrition and Your Health: Dietary Guidelines for Americans," DHHS and USDA, Government Printing Office.

(7) The claim may state that individuals with elevated blood total- or LDL-cholesterol should consult their physicians for medical advice and treatment. If the claim defines high or normal blood total- or LDL-cholesterol levels, then the claim shall state that individuals with high blood cholesterol should consult their physicians for medical advice and treatment.

(e) *Model health claims.* The following are model health claims that may be used in food labeling to describe the relationship between dietary saturated fat and cholesterol and risk of heart disease:

(1) While many factors affect heart disease, diets low in saturated fat and cholesterol may reduce the risk of this disease;

(2) Development of heart disease depends upon many factors, but its risk may be reduced by diets low in saturated fat and cholesterol and healthy lifestyles;

(3) Development of heart disease depends upon many factors, including a family history of the disease, high blood LDL-cholesterol, diabetes, high blood pressure, being overweight, cigarette smoking, lack of exercise, and the type of dietary pattern. A healthful diet low in saturated fat, total fat, and cholesterol, as part of a healthy lifestyle, may lower blood cholesterol levels and may reduce the risk of heart disease;

(4) Many factors, such as a family history of the disease, increased blood- and LDL-cholesterol levels, high blood pressure, cigarette smoking, diabetes, and being overweight, contribute to developing heart disease. A diet low in saturated fat, cholesterol, and total fat may help reduce the risk of heart disease; and

(5) Diets low in saturated fat, cholesterol, and total fat may reduce the risk of heart disease. Heart disease is dependent upon many factors, including diet, a family history of the disease, elevated blood LDL-cholesterol levels, and physical inactivity.

HDL-3, TG and VLDL-TG increased when all women considered as a group. Blood lipid results (all subjects in mg/dL) AMER AHA 3 TC 202 189 LDL-C 133 121 HDL-C 52 49 When women were divided into 3 groups based on BMI, leanest women had a significant decrease in TC, LDL-C and HDL-C. Blood lipid (mg/dL) response grouped by BMI <24 <30 >30 TC 169 202 199 LDL-C 106 130 128 HDL-C 49 57 40 Moderately and grossly obese women were nonresponders.	Results suggest that obesity, at least in women (n=6 BMI>30) had an influence on responsiveness to low-fat, low-cholestarol diet. Authors suggest that obese women may be carbohydrate-sensitive and therefore less responsive to low fat, low SFA diet.
: Baseline SFA, Canola MUFA and il enriched in provided, te and onitored. Calories MUFA PUFA 39.9 39.3 7.2 7.4 22.8 8.1 10.7 22.2	Compared to SFA enriched diet, platelet PL fatty acid composition was altered. MUFA enriched diet (canola) raised conc of oleic (MUFA) and linolenic (PUFA); there was a significant decrease in oleic and increase in linoleic with the PUFA enriched diet (safflower). Both vegetable oil diets produced increase in SFA (lauric and palmitic), a decrease in stearic acid of PL fatty acids of platelet compared to SFA diet. Both vegetable oil diets significantly increased platelet aggregation time compared to platelet from SFA diet. Data: Diet Aggregation. MUFA ↑ PUFA ↑ SFA ↓	Authors discussed the possible mechanism by which UFA from vegetable oils may platelet aggregation time. The authors suggest that vegetable oils: canola oil, may alter platelet aggregation by PG metabolism and membrane fluidity and safflower oil by membrane fluidity. The authors also suggested that the increased conc of 2 SFA (palmitic and stearic) in PL of platelet may not be prothrombic.

Report given on 23 participants from John Hopkins in which prevastatin reduced TC 23% [about 265 down to 200 mg/dL] and LDL-C 30% [about 210 down to 150 mg/dL] over the year. TG and HDL did not change. Dietary compliance and evaluation given. 55% of men in study completed 7 diet records for 1 year. For both men and women the percentage of calories from total fat was (30%), SFA (8%), PUFA (9%) and MUFA (10%). Approximately two-thirds of participants ingested less that 67% of RDA of some essential mineral and vitamin nutrients.	Intervention with lipid lowering drug did not alter dietary compliance. Patients adhering to lipid lowering diets in which the fat content was similar to that recommended for general population (30% of calories), appeared to contain inadequate amounts of several essential nutrients (folic acid, vitamin B-6, calcium and zinc). Greater than 40% of women ingested less that 67% of the RDA for folic acid, vitamin B-6, vitamin D, calcium and Zn. Compared to general population the nutrient amounts were greater for zinc and calcium but less for vitamin B-6 and folic acid than that found in general population. In men the diet was inadequate in folic acid and zinc. Lipid lowering diet may be inadequate in several micronutrient. Other studies have however found these diets provide adequate amounts of these nutrients.
eriod was 1 ing test diet. ier except for tion of bread nate (9.9 g/150 ydrate). diet records ay 3 of each omposition calories) ol Propionate 53 18 29.5 2 19.6	A significant decrease in blood glucose response was observed with use of propionate-supplemented bread compared to control bread. No significant changes were observed in total cholesterol, LDL-C, HDL-C or triglycerides. 5 subjects however showed a reduced level of HDL-C and increased triglycerides with propionate-supplemented bread use. Data: mmol/L (mg/dL) Control Propionate TC 5.0 (193) 4.8 (185) LDL-C 3.2 (123) 2.0 (77) HDL-C 1.3 (50) 1.1 (42) TG 1.3 1.8	Short dietary test period, non-steady state conditions, no wash-out between diets. No indication of other confounders for glucose or lipid response (concentration of PUFA, MUFA SFA or cholesterol). Does not confirm previous reports which suggest SCFA decrease total cholesterol by inhibiting HMGCoA reductase (or the synthesis of cholesterol)..

structed and Food records Analysis of 4- ords every 6 d lipid 6, 12 and 18 position at % of calories) 31.6 10.6 6.8 11.5 50 16.8 232 5.9 1,975	Modest but significant decreases in TC (-2.6%) and LDL-C (-3.5%) were observed at 6 weeks. No further reduction in TC or LDL-C were found at 12 or 18 weeks. By 18 weeks, TC and LDL-C levels showed a tendency to return to and even exceed baseline levels. Small increase in HDL-C (2.1%) and TG (3.8%) at 18 weeks. Blood lipid data in mg/dL at (6 weeks) and (18 weeks) BL AHA(6) AHA(18) TC 242 235 245 LDL-C 169 163 170 HDL-C 49 49 50 Diet results: 1. total dietary fat decreased at 6, 12 and 18 weeks (minus 2.7, 2, and 2.4% respectively). 2. SFA and cholesterol consumption decreased also at 6, 12 and 18 weeks for SFA (minus -1.6, -1.5, and -2.4) and -46% and -50% for cholesterol at 12 and 18 weeks.	The AHA Step 1 diet was not effective in improving plasma lipids of these subjects. This may be due to fact that most participants had already achieved a low level of SFA and cholesterol intake at baseline. All participants knew they were hypercholesterolemic prior to the study and were already following a self developed diet. Those subjects who responded the best were older, had higher LDL-C levels and had higher intake of total and PUFA at baseline.
tive classes, /week. del based on eart study, Tables, Survey Data. mate average sociated with or more CHD . Into model ctors are age, sex, ood pressure, terol, left hypertrophy , ference and oking. also made for nder specific tion for men	Ability to forecast lifetime benefits depends on baseline levels, age, sex, and presence and absence of other risk factors. Reducing serum cholesterol levels 5 to 33% increases the average life expectancy 0.03 year or 11 days to 3.16 years. The average onset of symptomatic CHD would be delayed by 0.06 or 22 days to 4.98 years. Among 35 year old men and women, without other risk factors, reducing cholesterol from 300 to 200 mg/dL with diet or medication would increase life expectancy 1.64 year (men) and 0.98 year (women).	Computer model used is based on relatively short term clinical data - 5 to 10 year to predict lifetime benefits. Wide variation in results from reduction of blood cholesterol in men and women of various ages. Results similar to other models used to estimate benefit from lowering blood cholesterol. For example Taylor mode: a 6.7% decline in total cholesterol increased life expectancy 3 days to 3 months for low-risk men and women age 30 to 60 years.
n diet (fat 26 lories) and n 5 to 10 km, per week) for r to study. nt diets days each diet , one test per cross country m. enium measured activation; by high iquid hy; gas aphy of methyl vative of lipid plasma PUFA.	Cases, compared to controls had significantly high levels of total cholesterol and LDL-cholesterol and lower levels of diastolic blood pressure and HDL-cholesterol. Plasma selenium was significantly lower in cases compared to controls. No significant differences in tocopherol or PUFA's. In subgroup of case where tocopherol is low (less than 1452 ug/dL), there is a corresponding significant lower ratio of selenium/PUFA.	Dietery history, which could impact on these results, was not provided in study. Study lacks a control group which had no previous history of or who had no MI or atherosclerosis. Also subjects had many other risk factors which may relete to the results i.e., smoking and not directly to atherosclerosis. The reason for evaluating the study wes because of safety concerns with proposed changes dietary composition due to a decrease in SFA consumption and replecement with other nutrients such as PUFA and micronutrient status (such as antioxidants) have been expressed. Some previous reports suggested thet selenium wes significantly lower in acute MI or those who died from CVD.
our dietary months apart. t itative food questionnaires tely 6 months	Boys had slightly higher serum TC and LDL-cholesterol than the total group or the girls. Children in the highest tertile of total fat consumption (36.2% of total calories) compared to the lowest tertile (30.2% of calories) had significantly higher TC and LDL-cholesterol Furthermore, children in the highest tertile of SFA consumption (14.6 % of calories) compared to lowest tertile (11.2% of calories) had significantly higher TC and LDL-cholesterol levels. 	Results	Comments
y period cycle. n placed or 4 l witched r 4 rovided, repared on. 0 kcal lata (%	Plasma cholesterol levels were lower during luteal phase of menstrual cycle regardless of diet. Blood total cholesterol data (mg/dL): Diet groups 1 2 3 4 Follicle 160 152 157 154 Lauteal 149 140 152 149 In general low-fat, and higher portion of PUFA in the diet increased lipoprotein fluidity. Fluidity of VLDL was related to oleate and linoleate. Fluidity of LDL and HDL, however, showed an inverse relationship to oleate and linoleate content.	It is difficult to evaluate study based on P/S ratio, without grams or percent of SFA, PUFA, and MUFA in the diet. It is possible that the SFA content of the diet was the same throughout the study. This was not the case in this study as shown by composition in g of SFA content. No consistent relationship emerged from the study to indicate that lipoprotein fatty acid content determined either LDL-C or HDL-C fluidity. The dietary cholesterol content was more significant than fatty acid content in determining LDL fluidity. This result would suggest another important role of dietary cholesterol separate from its effect on blood cholesterol levels. Changes in fluidity of lipoprotein particles may in tern alter their interaction with receptors and therefore alter the fate of blood cholesterol levels

onsumed each 9 days with a 4- out with iet. Lunch was n hospital eals consumed at intervals. struction was dietary records for breakfast meals. Rate of of retinyl was used as a measure rate of tion was added eal on day 9 of ntained 2,400 36.5% and % of calories; 294 mg/day. ories - diets:] SFA PUFA 21 10 12 9 3 18	Consumption of the PUFA enriched diet resulted in a significant decrease in TC and LDL-C compared to SFA enriched diet. HDL-C was not significantly altered by diet. Blood lipid data (mg/dL) SFA PUFA TC 118 108 LDL-C 71 59 HDL-C 38 36 Other results: There was a 43% decrease in chylomicron and their ruminants as well as a 20% decrease in VLDL due to consumption of the PUFA enriched diet. Chylomicron remnants were 43% more rapidly removed on diet rich in PUFA compared to diet rich in SFA. Since the rate of absorption is the same, an increase in the rate of clearance of triglyceride and cholesterol rich particles may explain the significant decrease in blood levels of these lipoprotein particles by PUFA-enriched diet.	Because of the short duration of the study (9 days), applicable results refer to short half-lived lipoprotein particles [chylomicron, VLDL and their remnants]. Under these circumstances cannot conclude whether or not the PUFA enriched diet altered the level of HDL. Second, the PUFA enriched diet was also reduced in SFA (about 10% of calories). This decrease in SFA content may account for decrease in TC and LDL-C observed. Thus added PUFA when substituted of SFA did not negate the cholesterol lowering effect of decreasing the SFA content of the diet. If future studies support these results such that a PUFA enriched diet increases the rate of clearance for chylomicron remnants, this could suggest a decreese in a lipoprotein particle of atherogenic potential.

thods	Results	Comments
s taken from uter quedrent buttock. Serum al cholesterol, erol end es] were enzymaticelly ernight fest. erol determined ewald equation.	Adipose linoleic content, which varied widely was lowest in men from Poland (8.6%) and highest in men from Belgium (16.7%). Linolenic acid content was lowest in men from Italy (0.5%) and highest in men from Sweden and the Netherlands (0.9%). Linoleic acid was negetively correleted with LDL-C (-0.15, p< 0.01) and totel cholesterol (r=-0.17, p<0.01). Linolenic acid was negetively correlated with serum triglycerides (r=-.14, p<0.05). There was a significent difference in HDL-C levels , with the highest level in men from Italy, Belgium, and Sweden and the lower concentretion in men from Poland. Totel cholesterol and LDL-C was highest in Italian males [TC= 6.2 mmol/L and LDL-C= 4.2 mmol/L] but lowest in Swedish men [TC= 5.7 mmol/L and LDL-C= 3.9 mmol/L].	The euthors concluded thet there were major differences in these edipose unseturated fetty scids from different Europeen communities which correleted with some, but not all serum lipids. Adipose linoleic and linolenic content did not sdequately explein the significant differences observed in serum HDL-C end triglycerides.

Both PUFA and MUFA enriched diets significantly reduced TC and LDL-C from baseline. The MUFA enriched diet reduced TC and LDL-C more than PUFA enriched diet. Blood lipid data: mmol/L (mg/dL) BASE PUFA MUFA TC 5.3(205) 4.6(178) 4.5(174) LDL 3.2(123) 2.6(100) 2.4 (93) HDL 1.3 (51) 1.3 (50) 1.3 (51) The differences between test diets in TC and triglyceride (TG) were more pronounced in women but statically insignificant from men. Conversely, the test diets effected LDL-C and HDL-2 of men more than women.	MUFA enriched diets were shown to be equally effective as PUFA enriched diet in reducing TC and LDL-C levels in men and women. HDL-C was not significantly reduced by consumption of PUFA or MUFA enriched diet. If PUFA is at or below 10 to 13% calories, HDL-C levels do not appeared to be lowered. Study results suggest cannot rely on Key equation to predict the effect of MUFA and PUFA on serum cholesterol levels.

not differ from er other than y acid which was al energy. Trans d (TFA) prepared oleic acid oil; ted with d nickel and mixed 75 TFA to 25 parts d rich oil. (S.A.) inter- d from a mixture ts of ted high linoleic lower oil to 50 h oleic sunflower parts of d high linoleic oil. Diets as % calories: L.O.= ; Trans= trans S.A.= stearate . S.A. TRANS 43 40 20 10 17 23* 4 4 33 33 trans MUFA	Compared to levels of serum cholesterol on linoleate diet both stearate and trans fatty acid enriched diet significantly increased TC and LDL-C levels. In addition, both stearate and trans fatty acid enriched diet significantly reduced HDL-C compared to linoleate enriched diet. Blood lipid data (mg/dL) L.O S.A. TRANS TC 183 189 189 LDL 109 116 119 HDL 57 54 53	Consumption of trans fatty acid enriched diet which is closer to some subpopulation groups in U.S. increased blood risk factors for CHD. Broader spectrum of subjects than in earlier Mensink and Katan study. Trans fatty acid consumption of total calories and g/day: Current U.S. 3 to 4% or 7 to 10 g/day; Zock and Katan study 7.7% or 24 g/day; Mensink and Katan study 11% or 33 g/day. The authors suggest that every one percent of energy from trans fatty acids increases LDL-C 1.2 mg/dL and lowers HDL-C 0.6 mg/dL relative to oleic and linoleic acid. Therefore at current U.S. consumption of 3 to 4 % of calories, contributions from trans fatty acid could increase LDL-C by 4 mg/dL and decrease HDL-C by 2 mg/dL.

ed usual diets t 37% and Carb 43% ies (2,540) and at was 36% and of 2,000] with exception of dietary oil. subjects consumed iched diet er oil- enriched eic acid) for 12 Phase 2: subjects MUFA enriched ive oil- enriched acid) for 28 Vegetable oils d 44% of dietary % of total s) for men and 50% ary fat (18% of s for women). omposition as % of otal calories PUFA MUFA 37 36 12 12.5 11 20 12.8 3.4 460 337 y)	Blood lipids were analyzed in week 10 and 12 of the PUFA enriched diet and weeks 4, 8, 12, 16, 28 weeks of the MUFA enriched diet. In this study the PUFA is the baseline of comparative diet. Phase I. Blood lipid data at 12 weeks (expressed in mmol/L and mg/dL) Men Women TC 4.93(190) 5.2(201) LDL 3.3(126) 2.48(96) HDL 1.0(39) 1.3 (51) In Phase 2 (at week 16 for men and 28 for women respectively, on the MUFA enriched diet): nonsignificant reduction in TC and LDL-C, but HDL-C increased significantly for men. In women: TC increased significantly (to 5.7 mmol/L (220 mg/dL or by 9%), LDL-C was unchanged (2.4 mmol/L or 94 mg/dL) and HDL-C increased significantly (to 1.7 mmol/L or 66 mg/dL or by 30%). No blood lipid data was provided for men at week 28 of study. The authors used an atherogenic index defined as (TC:HDL-C) to compare the effects of PUFA to MUFA diets: in men the atherogenic index fell 12% and 17% in women.	Larger and longer dietary intervention study than many of previous studies. The paper did not report baseline cholesterol values. Study which lasted up to 28 weeks allows for some estimation of possible long-term effects of MUFA compared to PUFA on blood lipids. Compared to the PUFA diet, the MUFA enriched diet significantly increased HDL-C levels without increasing TC or LDL-C for both men and women. The increase in HDL-C due to consumption of the MUFA enriched diet was larger in females than males. Public health significance: diets were similar in the total fat content to the American diet, but had a higher percentage of MUFA suggest that longer term consumption may reduce total and LDL-C without reducing and perhaps increasing HDL-C levels.

SFA and acids together was calories.	Body weight decreased on both diets casein and soy diets and on both low and high cholesterol diets. TC, triglycerides and VLDL-C levels were similar on casein and soy, regardless of the cholesterol content of the diets. On a low-cholesterol diets, the mean plasma levels of LDL-C and HDL-C were identical and not dependent on source of dietary protein. On a cholesterol enriched diet, however, LDL-C levels were significantly lower on the soy protein diet and HDL-C was significantly higher. Blood lipid data (mg/dL) Low Chol / Enriched Chol CAS SOY CAS SOY TC 124 127 138 133 LDL 68 66 81 68 HDL 42 43 47 53	Results suggest an interaction between source of dietary protein (plant and/or animal) and dietary cholesterol on levels of blood LDL-C and HDL-C concentrations. On cholesterol enriched diet, the source of dietary protein appears to be more important in determining serum cholesterol levels than on a low cholesterol diet. This study is of public health significance, since the results suggest that on a cholesterol enriched diet, such as found in the U.S., casein (animal protein) increased LDL-cholesterol while simultaneously reducing the HDL- cholesterol.

Randomly to three c diet groups (7 roup 1 (ADD); AHA Step 1); AHA + SFA). composition: total calories 0 Step 1 SAT 29 29 8.6 12 12.8 10.6 7.6 6.3 303 347	Refer to baseline data: Overall the switch to Step 1 diet significantly decreased total cholesterol by 0.36 mmol/L or 14 mg/dL (7.5%). Men on SFA/Step 1 diet had non-significant decrease in total cholesterol of 0.08 mmol/L or 3.1 mg/dL (1.6%) compared to AAD diet. Switch to Step 1 diet significantly decreased LDL-cholesterol 0.25 mmol/L or 9.6 mg/dL (8.1%). Consumption of SFA diet was associated with a decrease of 0.03 mmol/L or 1.1 mg/dL (1.1%). Switch to Step 1 diet significantly decreased HDL-cholesterol 0.11 mmol/L or 4.2 mg/dL (8.6%). Switch to SFA diet decreased HDL-cholesterol by 0.06 mmol/L or 2.3 mg/dL (4.6%.)	No significant decreases in total or LDL-cholesterol were observed in healthy males when total calories from fat was reduced from 37% to 30%. Significant reductions in total and LDL-cholesterol were observed in healthy males when both total fat and saturated fat content of the diet was reduced.
diet (3 weeks), by 3 week diet tion which was by 3 week return ine diet. No eggs on baseline ietary tion included of three eggs day or addition of xtra dietary rol. Energy intake measured during tion. Body weights d during the	There were no significant differences between males and females either during intervention or switchback. Three week of cholesterol enriched diet induced significant increase in total and LDL-cholesterol, and apo B concentration in all 4 phenotypes. In all phenotype groups, HDL-cholesterol increased with dietary cholesterol consumption. All lipid classes returned to original concentrations after switchback. The response in blood LDL-cholesterol and apo B to the cholesterol rich diet was greater in apo E4/4 subjects. The above statements on response to dietary cholesterol are the authors and supported by figures of the data in the paper.	Insufficient dietary data provided to evaluate study accurately. Did not record saturated fat and cholesterol contents in the baseline and intervention diets. Stronger responses by apo E4/4 phenotypes, suggests these individuals are more sensitive to dietary cholesterol (increased two-fold over other phenotypes). In Finland about 6% of the population is of the apo E4/4 phenotype.

Other: lity to modification was n 2, 2'azobis (2-ane) dihydro- (AAPH). AAPH is oluble diazo that generates cals by us thermal tion.	Both diets significantly lowared total and LDL-cholesterol. Blood lipid data mmol/L (mg/dL) Baseline MUFA PUFA TC 4.7(181) 3.8(148) 3.5(136) LDL 3.2(125) 2.6(100) 2.3 (90) HDL 1.1(44) 1.0 (40) 0.98(38) TG 1.1 0.8 0.7 Other: The peroxidation rate was significantly higher when patients were on PUFA diet compared to MUFA diet. No significant differences were observed for inhibition of peroxidation by either diet.	Replacement of calories from SFA by either MUFA or PUFA induced a significant hypocholesterolemic effect. In addition, the results of the study support the hypothesis that diets rich in MUFA increase resistance of LDL-cholesterol to oxidative modification, independent of their content of antioxidants. Changes in peroxidation rate suggest that once LDL-cholesterol is depleted of antioxidant content, a diet enriched in MUFA may allow LDL-cholesterol to resist oxidative stress. Ratio of oleic to linoleic in LDL was inversely correlated with the peroxidation rate.

Study	Study Design	Subjects	Methods
Zimetbaum, P. et al (Ref. 218)	Epidemiological, prospective study. Purpose: to access the correlation of lipid and lipoproteins levels on CVD risk, stroke, dementia, and death in the elderly. Study site: New York, (10-year follow-up of the Bronx Aging Study (BAS))	Mean age of entry into BAS study was 79 years, who did not have any diagnosed terminal illness or dementia. From BAS enrollment of 488, 350 had two lipid determinations at 10 years. Subjects had about a 7 to 9 th grade education, 60% were men and 25% of women were smokers, 48% of subjects took diuretics.	Extensive medical and psychosocial historie taken, laboratory screening, neurologic and neuropsychiatric testing. CVD included stroke and other hear related deaths. All e verified by reviewing medical records and/o death certificates.

Mean blood lipid values: (mg/dL) Total chol: Men 207, Women 234 LDL-C: Men 140, Women 158 HDL-C: Men 38, Women 46 Proportional hazards analysis showed that men with consistently low HDL-cholesterol levels (<30 mg/dL) were independently associated with the development of MI, CVD and /or death. For women, elevated LDL-cholesterol (>171 mg/dL) was associated with MI.	Using both univarient and multiveriant analysis, only a consistently low HDL-cholesterol was significantly and independently associated with MI or all cause mortality in elderly men even after controlling for smoking and hypertension. For elderly women only a consistently elevated LDL-cholesterol was associated with MI. No significant associations between lipids and dementia were observed for either men or women. These results are in contrast to Framingham report which reported that baseline low HDL-cholesterol levels was associated with increased risk of MI and or death in both elderly and middle aged men and women. Elevated total cholesterol was not found to be an independent risk factor for MI or death.

Food and Drug Administration

21 CFR Part 101

[Docket No. 91N-0097]

RIN 0905-AD08

Food Labeling: Health Claims and Label Statements: Dietary Fat and Cancer

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is authorizing the use on the labels and labeling of certain foods of health claims relating to an association between dietary fat and cancer. This final rule is issued under provisions of the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) and was developed in accordance with the final rule on general requirements for health claims, which is published elsewhere in this issue of the Federal Register. The agency has concluded that, based on the totality of the scientific evidence, there is significant scientific agreement among qualified experts that diets low in fat may reduce the risk of some cancers. Therefore, FDA has concluded that claims on certain foods relating fat reduction to reduced risk of cancer are justified.

EFFECTIVE DATE: May 8, 1993.

FOR FURTHER INFORMATION CONTACT: Helen HeChong Lee, Center for Food Safety and Applied Nutrition (HFS-226), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202-205-5558.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of November 27, 1991 (56 FR 60764), FDA proposed to authorize the use on food labeling of health claims relating diets low in fat to reduced risk of some types of cancer, particularly breast, colon, and prostate, in the general population (hereafter referred to as the lipids/cancer proposal). The lipids/cancer proposal was issued under provisions of the 1990 amendments (Pub. L. 101-535) that bear on health claims and in accordance with the proposed general requirements for health claims for foods (November 27, 1991, 56 FR 60537). As amended in 1990, the Federal Food, Drug, and Cosmetic Act (the act) provides that a food is misbranded if it bears a claim that characterizes the relationship of a nutrient to a disease or health-related condition unless the claim is made in accordance with section 403(r)(3) or (r)(5)(D) of the act (21 U.S.C. 343(r)(3) or 343(r)(5)(D)).

Section 3(b)(1)(A) of the 1990 amendments specifically requires that the agency determine whether claims respecting 10 nutrient/disease relationships meet the requirements of section 403(r)(3) or 403(r)(5)(D) of the act. The relationship between lipids and cancer is one of the claims required to be evaluated. In the Federal Register of March 28, 1991 (56 FR 12932), FDA published a notice requesting scientific data and information on the 10 specific topic areas identified. Relevant scientific studies and data received in response to this request were considered as part of the agency's review of the scientific literature on lipids and cancer and were included in the lipids/cancer proposal. Comments received in response to the notice and not specifically addressed in the lipids/cancer proposal are summarized and addressed below.

In addition to evaluating the scientific evidence, the lipids/cancer proposal identified qualifying and disqualifying nutrient levels for foods bearing health claims on fat and cancer. The lipids/cancer proposal also specified mandatory and optional information for health claim statements and provided sample messages. FDA requested written comments in response to its proposed rule. In addition, FDA held public hearings on January 30 and January 31, 1992, on all aspects of the proposed rules published in response to the 1990 amendments, including health claims for lipids and cancer.

II. Summary of Comments and the Agency's Responses

In response to its proposed health claim regulation on lipids and cancer, the agency received approximately 80 letters, each containing one or more comments, from consumers, consumer groups, health care professionals, professional organizations, State and local governments, a foreign government, trade associations, and industry. A number of comments received on this proposed rule were more appropriately addressed in other documents, and these comments were forwarded to the appropriate docket for response.

A. Validity Issues

1. Many comments addressed the basic issue of whether FDA should permit any health claims about total fat and/or any particular type of fat and cancer on food labeling. Several comments objected to the lipids/cancer claim and suggested that results from epidemiologic studies are often inconclusive and do not provide the information necessary to identify the type of fat that is responsible for cancer. Some comments felt that claims about saturated fat and cancer, but not about total fat and cancer, may be justified, but did not provide any data to document this conclusion. Other comments noted that results from animal studies suggest that dietary lipids do not affect noncarcinogen-induced tumorigenesis. Some comments suggested that animal studies reported conflicting results on the relationship between dietary lipids and cancer. Other comments expressed concern that rodent studies were extrapolated to humans without considering species differences.

Conversely, there was widespread support from organizations of nutritionists, organizations of health professionals, scientific societies, consumers, and food manufacturers for the agency's proposed rule. Most of these comments took the position that there was adequate scientific evidence to support claims about total fat and cancer, and concurred that these claims should be permitted. Some of these comments stressed that the recommendations from Federal government agencies and other authoritative scientific organizations, which concluded that diets high in fat increase the risk of cancer, are widely accepted in the scientific community.

FDA agrees that the totality of scientific evidence provides considerable support for a claim about the relationship between high intakes of dietary fat and increased risk of some cancers and that the conclusions and recommendations reached in a number of Federal government and other authoritative documents about this relationship demonstrate the existence of significant scientific agreement among experts qualified by experience and training to evaluate such evidence. In developing its proposed regulation, FDA has reviewed Federal government reports and other review documents as well as recent research articles relevant to dietary lipids and cancer risk. Authoritative documents consistently and independently conclude that dietary fat contributes to the risk of some cancers. Among human studies, results of international correlational studies consistently and strongly show that dietary fat may play a role in cancer. Also, the independent review by the Life Sciences Research Office (LSRO) concurred with FDA's conclusion that high fat intake increases

the risk of developing cancers. Furthermore, as discussed in section III of this preamble, new studies that became available for review after the publication of the lipids/cancer proposal are consistent with the agency's conclusion that high fat intake is associated with increased risk of some cancers.

FDA considers it appropriate to permit health claims about fat and cancer without identification of the type of fat that is responsible for the cancer. As the agency explained in the preamble of the proposal (56 FR 60764 at 60773), the available scientific evidence is inconclusive in linking a specific type of fat to cancer risk. As presented in the proposal, some evidence has been found in both human studies and animal studies that all three types of fat (saturated, monounsaturated, and polyunsaturated) may be associated with the risk of some types of cancer. Because it was not possible to clearly identify a particular type of fat or fatty acid, and because several types of fatty acids have been implicated in cancer risk, the agency based its claim on the total fat content of the diet, rather than on any specific type of fat or fatty acid. Further, as explained in section III of this preamble, the evidence from new animal studies generally supports the conclusion drawn in the proposal that total dietary fat is associated with the risk of cancer. Of course, if more conclusive evidence becomes available about specific roles of different types of fat, any interested person may submit a petition under the provisions of new § 101.71 to revise the regulation on identification of the specific types of fat that affect cancer risk, or FDA may itself initiate action to revise the regulation.

The agency does not consider the absence of evidence from noncarcinogen-induced tumorigeneses in animal studies to be a major flaw in determining the adequacy of the scientific evidence to support a relationship between dietary fat and cancer. The data, which indicate that fats cannot initiate tumorigenesis (tumor growth), do not call into question the validity of FDA's evaluation of animal studies. The current understanding of the process of tumorigenesis involves a two stage model: initiation of the carcinogenic process, followed by promotion of tumor growth. During initiation, a normal cell is altered to become a latent cancer cell. This is presumably accomplished when a carcinogen interacts with and subsequently alters the genetic apparatus of the cell. During tumor promotion, the altered genes are expressed to make new cells, a process leading ultimately to autonomous cell growth that is no longer responsive to normal physiologic growth regulatory signals. As FDA explained in the preamble of the lipids/cancer proposal, current knowledge about tumor growth shows that dietary fat affects the promotional stage, not the initiation stage, of carcinogenesis (56 FR 60764 at 60768). Substances affecting the promotional stage of carcinogenesis are appropriate subjects of health claims because, in the promotion stage, the ultimate development of cancer that cannot be controlled by the body is still in question. Thus, risk of cancer may still be reduced in the promotion stage.

As described in the lipids/cancer proposal, FDA agrees that extrapolation of the data from animal studies to humans is limited by differences in metabolism and physiology between species. However, experiments in different animal species permit more intensive observation under controlled experimental conditions. The agency believes that a careful evaluation of animal studies provides useful information and can provide valuable insight into mechanisms involved and specificity of fat versus other nutrients. Thus, the agency critically evaluated animal studies using the evaluation criteria found in the lipids/cancer proposal (56 FR 60764 at 60767). Furthermore, the rodents, which are used in most of the studies reviewed, have digestive and/or metabolic systems that are similar to humans and have been widely used in cancer studies. The agency did not include studies that utilized cell culture techniques because cells can be genetically transformed during the in vitro culture phase, thus generating data that are substantially different from findings in human physiology.

B. Cancer Sites

2. Although most comments took the position that claims about total fat and cancer should be permitted, a number of comments expressed differing opinions about whether claims should specifically address the types of cancer affected by a diet that is low in total fat. Several comments supported the agency's proposed § 101.73(b)(1)(iii) (56 FR 60764 at 60779) to restrict claims to cancer of the breast, colon, and prostate. One explained that, without some identification of affected cancers, the claims may be misinterpreted as meaning that all types of cancer are affected. The comment suggested that FDA require the phrase, "particularly colon, breast, and prostate cancer" in the health claim.

On the other hand, several comments suggested that FDA exclude the designation of specific cancer for the sake of simplicity or because of the inconclusiveness of the relevant scientific evidence. Some comments stated that the magnitude of the association between dietary fat and the risk of various cancers such as breast cancer, colon cancer, and prostate cancer varies so widely that it is misleading to presume that strong evidence supports each site. The comments asserted that claims should therefore not be site-specific.

FDA has reconsidered the issue of requiring claims to identify the specific sites of cancer that may be affected by total fat content in the daily diet. The agency no longer believes that the current state of the scientific evidence on this issue justifies such specific identification. As is fully discussed in the preamble of the lipids/cancer proposal (56 FR 60764 at 60772 and 60773), when FDA proposed such identification, the agency did so because an international correlation study found an association between fat intake and cancer of the breast, colon, and prostate, but not of cervical or lung (Ref. 38). The agency, therefore, concluded that the effect of fat on cancer may be site-specific. In view of the lack of evidence for other types of cancer, the agency believed health claims would not be justified unless the claims pertained only to cancer of the breast, colon, and prostate.

However, additional studies that were not available for review at the time of the lipids/cancer proposal contain further evidence that cancers of additional sites may also be affected by dietary fat intake. Further, the evidence for an association of an increased risk of breast cancer with dietary lipids appears not to be as strong as previously thought from the findings in many case-control and cohort studies (See section III of this document). Thus, FDA now concludes that the identification of specific sites of affected cancers is no longer as appropriate as FDA believed when it issued the proposal. In view of the weaker data on breast cancer and the possibility of a wider variety of affected sites, and taking into account comments received, FDA believes that health claims should not be permitted to refer to specific cancer sites. At the same time, the agency feels that it would be misleading to imply that risk of all cancers may benefit from low fat diets. Accordingly, FDA has included a provision in § 101.73(c)(2)(B) of the rule set forth below requiring that health claims use the terms "some types of cancer" or "some cancers" in specifying

the disease. All provisions in the rule addressing specific sites of cancer have also been revised accordingly.

FDA points out that the lack of consistency of more recent studies with earlier studies concerning the relationship between breast cancer and fat intakes does not bring into question the more general validity of conclusions pertaining to dietary fat intake and cancer that were discussed in the agency's response to the previous comment. The absence of clear evidence of a strong association between fat and breast cancer in many case-control studies may be due to the dietary homogeneity of the population studied. International correlation studies, which have the greatest variability in dietary fat intakes among the populations examined, have consistently found an association. But correlational studies cannot control for important confounding factors, such as family history of cancer and reproductive history, which may also explain the correlations found between fat intake and cancer mortality in these studies.

C. Advisability of Permitting Claims

3. Some comments asserted that, regardless of whether claims about total fat and cancer may be valid, such claims should not be permitted because of safety considerations. A number of comments maintained that health claims about total fat may increase the risk of heart disease from reduced intakes of certain nutrients (i.e., essential fatty acids and fat soluble vitamins). One of the comments stated that the polyunsaturated and monounsaturated fats in vegetable oils have well-documented advantages, particularly in beneficially affecting the ratio of blood total cholesterol to HDL-cholesterol (i.e., raising the level of HDL-cholesterol relative to total cholesterol levels). The comment also pointed out that vegetable fats are the primary source of vitamin E in U.S. diets, and asserted that half of the U.S. population is below the recommended level of consumption of this vitamin. The comment stated that there is emerging evidence for a protective role of vitamin E in cardiovascular and other important diseases.

The agency does not foresee that a health claim relating diets low in fat to reduced risk of cancer will increase the risk of coronary heart disease because of reductions in HDL cholesterol. Under the provision of 1990 amendments, FDA evaluated scientific evidence on the relationships between dietary fat intakes and the development of two chronic diseases, cancer, and cardiovascular disease, separately. FDA's evaluation of the lipids/cardiovascular disease relationship is found in a companion document elsewhere in this issue of **Federal Register**. In that document, FDA is requiring that foods bearing a saturated fat and cholesterol/heart disease claim be "low in fat" in addition to being low in saturated fat and cholesterol. All current dietary guidelines from the Federal government and other authoritative reports include recommendations for diets low in fat when dealing with diet and heart disease relationships. Diets containing 30 percent or less of calories from total fat are deemed helpful in reducing the risk of heart disease because they facilitate meeting dietary goals for saturated fat and cholesterol. Furthermore, these diets are useful in maintaining moderate calorie intakes and desirable body weights. None of the authoritative reports or guidelines have noted concerns or evidence for inadvertent safety problems if Americans were to follow general dietary guidelines for reducing fat intakes to 30 percent of calories or less. Admittedly, diets very low in fat may pose a risk. However, given current fat intakes in the U.S. population of approximately, on average 37 percent of calories from fat, and given the difficulty in lowering this level significantly within the context of dietary patterns in the United States, FDA has concluded that it is highly unlikely that the U.S. population will be able or motivated to lower total fat intakes to levels low enough to have adverse health effects. Indeed, reductions in total fat intakes, consistent with dietary guidelines, are likely to have a beneficial effect on blood HDL- to total-cholesterol ratios.

With respect to assertions that the lipids/cancer health claims will adversely affect the nutritional status of vitamin E or essential fatty acids or will have a negative impact on coronary heart disease because of decreased vitamin E consumption, FDA does not foresee that the lipids/cancer health claim will adversely affect the status of essential fatty acids and vitamin E. Deficiencies of essential fatty acids and vitamin E are very rare in the United States at this time. Furthermore, there is extensive epidemiologic evidence that low fat diets providing fat at 30 percent of calories or less are consumed by many population groups without apparent adverse effects (Ref. 141). Current dietary guidelines, which target no more than 30 percent of calories from fat to reduce coronary heart disease and cancer risks, are generally regarded as practical in controlling fat, saturated fat, cholesterol, and calorie intakes, and yet as more than adequate for providing adequate intakes of essential fatty acids, for facilitating absorption of fat-soluble vitamins, and for maintaining growth and development in children and adolescents 2 years of age and older (Ref. 141). Furthermore, the recommended approach to reducing intake of total fat is to increase consumption of vegetables, fruits, and whole grain products, choose lean meats, fish, and poultry, and low fat dairy products, and use fats and oils sparingly. These diets generally are not only low in fat, saturated fat, cholesterol, and calories, but also tend to be high in vitamins (including vitamin E and provitamin A). Additionally, essential fatty acid requirements can be adequately met with only about 1 percent to 5 percent of calories from fat, an intake level well below the recommended levels, and not practical to achieve in the United States. Thus, FDA sees little, if any possibility, that consumption of diets consistent with current dietary guidelines for fat intake will result in significant reductions in intakes of essential fatty acids or fat-soluble vitamins. Consequently, an adverse effect on risk of coronary heart disease is unlikely. Furthermore, scientific evidence is not clear, as yet, regarding the postulated, protective role of vitamin E in preventing the autoxidation of polyunsaturated fatty acids, a possible risk factor for heart disease.

4. A comment stated that the lipids/cancer claim ignores the positive role of fats in a healthy diet.

FDA agrees with the comment that dietary fats have important functions in foods and as a source of essential fatty acids and other nutrients. In the proposed rule, FDA acknowledged the physiologic functions of dietary fats. As described above, the agency foresees beneficial effects of reducing fat intakes relative to cancer risk, but does not foresee that nutritional deficiencies or harmful effects to health will occur. The agency does not consider it necessary to include statements in the health message as to the beneficial role of fats. The purpose of health claims is to provide useful information to consumers on nutrient/disease relationships. However, as noted in the final rule on general principles for health claims published elsewhere in this **Federal Register**, certain statements, including general statements about the role of nutrients in maintenance of good health, are considered to be dietary guidance outside the scope of the 1990 amendments. These types of dietary

guidance would be permitted as long as the information contained in them is truthful and not misleading.

D. Other Issues

5. A few comments stated that the proposed rule focuses only on fat and does not require that claims discuss other dietary components (e.g., complex carbohydrates or dietary fiber). These comments asserted that such a narrow focus is misleading and would not serve to educate the public about the broad issue of diet and cancer. The comments emphasized that health claims should be presented in the context of a total diet.

FDA agrees that health claims should be presented in a manner that enables the public to comprehend the relative significance of the claim in the context of the total daily diet. In fact, section 403(r)(3)(B)(iii) of the act specifically requires that a regulation that authorizes a claim require that the claim be stated in such a manner.

However, a review of the relationships of other dietary factors and cancer risk (apart from antioxidant vitamins and dietary fiber, which are discussed in final rules published elsewhere in this issue of **Federal Register**), is beyond the scope of the Congressional mandate. Thus, FDA does not agree that the lipids/cancer claim must specifically address the significance of other nutrients such as complex carbohydrates, dietary fiber, saturated fat, or cholesterol in relation to cancer risk. However, any interested party may petition the agency, in accordance with criteria described in the final rule on general requirements for health claims published elsewhere in this **Federal Register**, for additional nutrient/cancer claims to be authorized. As proposed, the fat/cancer health claim must include a statement that the development of cancer depends on many factors. This information is essential for understanding the context of the nutrient/disease relationship.

6. A few comments urged FDA to require health claims to advise that reductions in fat intake to less than 30 percent of total calories may be needed to reduce the risk of cancer. The comment argued that such information is needed because consumers may otherwise believe they are making meaningful reductions in fat intake when that is not the case. This comment pointed to FDA's observation in the proposal (56 FR 60764 at 60773) that studies with small differences in fat intakes among test groups (from 32 to 37 percent of total calories) failed to find a significant reduction in cancer risk.

FDA does not agree that it would be appropriate to require this information in the lipids/cancer health claim. This information would unduly add to the length and complexity of the health claim. However, FDA concurs that this information could be very useful to consumers. Thus FDA has provided for optional use of this type of information as part of a health claim, because it is contained in the significance statement of the final rule (new § 101.73(b)), and information from this section of the rule is permitted to be used on the label (new § 101.73(d)(1)).

7. In its proposed rule, the agency requested comments on whether a food that qualifies for a "reduced fat" or other comparative claim should be permitted to bear a health claim relating dietary lipids and cancer. Several comments supported FDA's proposal that foods must be "low fat" or "fat free" in order to carry this health claim. However, some comments objected to FDA's definition of "low fat." In addition to comments specifically addressing the proposed "low fat" or "fat free" requirement, FDA received a large number of similar comments on the "low fat" requirement that appeared in the general requirements for health claims, proposal (56 FR 60537).

FDA advises that the final rule is retaining the "low fat" qualifying criterion for health claims concerning fat and cancer. ("Fat free" foods necessarily meet the definition of "low fat;" therefore, to avoid redundancy, the agency is requiring only that a food meet the "low fat" definition.) Because the issue of "low" qualifying requirements is of a general nature (e.g., this criterion also pertains to the fat and heart disease health claim), most of the comments on this issue were filed in the docket of the proposal on general requirements for health claims. FDA has responded to all comments about this issue in the preamble of the final rule on general requirements for health claims, which appears elsewhere in this issue of the **Federal Register**. Discussions of FDA's definition of "low fat" are published elsewhere in this issue of the **Federal Register** in the final rule on requirements for nutrient content claims.

8. A few comments requested that FDA develop identical criteria for health claims on lipids and cancer and on lipids and cardiovascular disease, because the proposed criteria for these two topics are similar but not totally consistent, and any differences may be confusing to consumers. The comments further suggested that total fat be used as the "common denominator" because "consumers who reduce total fat intake are likely to be concurrently reducing saturated fat intake as well as cholesterol, even if not making a conscious attempt at either."

The agency will allow manufacturers to formulate their own claim combining the fat and cancer and the saturated fat/cholesterol and heart disease claim if the food meets the criteria for both claims. However, at this time, it is not appropriate to set identical requirements for health claims for dietary fat and cancer and for dietary saturated fat and cholesterol and risk of heart disease, because the two diseases differ in the nature of their relationship to dietary fat components. Current evidence demonstrates that it is total fat, rather than individual fat components, that is associated with an increased risk of cancer. However, there is a substantial body of evidence that demonstrates that high levels of saturated fat and cholesterol, rather than total fat, are associated with an increased risk of cardiovascular disease. For this reason, FDA has decided to maintain separate criteria for the fat/cancer and the saturated fat and cholesterol/heart disease health claims.

9. Several comments stated that the lipids/cancer health claim should identify energy intake as an independent factor for cancer rather than reduced fat intake, because energy excess, not fat, is the factor that increases risk of carcinogenesis. Another comment stated that, if fat has an independent effect on carcinogenesis, the need to reduce fat intake becomes more important, because by reduction of fat intake, reductions in intakes of energy and fat could be efficiently achieved.

FDA agrees that the scientific evidence on the association between dietary lipids and cancer includes studies that demonstrate that total energy intake may be an independent risk factor for cancer (Refs. 11, 17, and 23). However, the 1990 amendments instructed the agency to determine whether claims respecting dietary lipids and cancer, not energy intake and calories, meet the requirements of section 403(r)(3) of the act. The agency found that, currently, there is adequate evidence from animal studies and from human studies that total fat is a risk factor for some cancers, independent of the effect of total calories. Furthermore, decreasing the fat content of the diet appears to be a practical approach to reducing energy intakes and maintaining desirable body weights. However, if a health claim regarding energy intake and cancer is desired, such a claim can be handled by the petition process set forth in the general

requirements for health claims final rule published elsewhere in this issue of the Federal Register.

10. One comment suggested that FDA exclude omega-3 fatty acids from the calculation of total fat for deciding whether a food is "low fat" relative to cancer risk, because the effect of omega-3 fatty acids may be neutral or, even, tumor-suppressing.

The agency does not agree that the scientific evidence is adequate to establish that omega-3 fatty acids are neutral with respect to cancer risk. Most animal studies, although concluding that a diet high in fish oil suppresses tumorigenesis, have methodologic problems which make it difficult to extrapolate results to humans. Specifically, the diets used in most of these studies provided insufficient amounts of the essential fatty acid, linoleic acid, to support optimal tumor growth. Therefore, it is not possible to determine whether the observed tumor-suppression by the fish oil diets was caused by an insufficiency of essential fatty acids (linoleic acid) to support tumor growth, or by a direct inhibitory effect of the omega-3 fatty acids contained in the fish oils. FDA is, therefore, not persuaded to exclude omega-3 fatty acids from the calculation of total fat for deciding whether a food is "low fat" with regard to cancer risk.

However, interested persons who believe there is adequate scientific evidence to support a beneficial relationship between omega-3 fatty acids and cancer risk, may use the petition process described in the final rule on general requirements for health claims, published elsewhere in this Federal Register.

11. A number of comments on the general requirements proposal for health claims (56 FR 60537) suggested that FDA revise provisions of all health claims rules to be more understandable.

The agency agrees that all health claims rules should be made more understandable wherever practicable. FDA has, therefore, made a variety of nonsubstantive revisions of provisions of the regulations set forth below for clarity. For example, provisions have been grouped into general and specific requirements. The general requirements reference other regulations containing nutrition labeling requirements. The specific requirements are separated into requirements pertaining to the food and those pertaining to the claim. The model health claims have been simplified. The regulation has also been modified to permit fish and game meats that meet the requirements for "extra lean" in § 101.62 to bear the health claim. This change is in response to comments on the proposed fat and cardiovascular disease health claim, and will make both final rules consistent with each other. "Extra lean" fish and meats can play an important role in a low fat diet. Consistent with other health claims regulations, this regulation also permits the claim to indicate the prevalence of cancer in the United States.

12. A comment suggested that the final rule include a requirement that, in order to qualify for the lipids/cancer health claim, a food must contain a minimum amount of dietary fiber, because fiber intake is another dietary risk factor for cancer.

The agency disagrees that dietary fiber should be required to be included in a fat/cancer health claim, but does agree that diets rich in foods containing dietary fiber and many other nutrients are associated with reduced cancer risk. Dietary components that have been implicated in cancer development include fat, antioxidant vitamins, and fibers. Among these dietary components, fat intake has been reported as the most strongly associated component. Under the 1990 amendments, FDA evaluated scientific evidence on three separate health claim topics relevant to cancer: Fat and cancer, antioxidant vitamins and cancer, and fiber and cancer. Of these three topics, FDA has concluded that there is significant agreement about the relationship between fat and cancer. FDA's evaluation and decision about the other two health claims (published elsewhere in this issue of Federal Register) is that diets rich in fruits, vegetables and grain products, which are generally low in fat and high in dietary fiber and vitamins A and C, are associated with reduced cancer risk. However, the agency did not find the evidence sufficient to attribute this relationship to a specific nutrient contained in plant foods. Furthermore, the agency's review of scientific evidence found that almost all animal studies of fat and cancer employed defined experimental diets containing the same amounts of vitamins and fibers. Animal studies on the association of dietary fat with cancer development provide substantial support for the conclusion that the effect of fat intake on cancer development is independent of the effects of fiber and antioxidant vitamins. Therefore, the agency is not persuaded to add fiber content as a required qualifying criterion for the fat and cancer claim.

III. Review of New Scientific Evidence

In addition to its evaluation of the comments, FDA has evaluated the scientific literature that has become publicly available since the issuance of the proposal. The following represents a summary of the agency's evaluation of this literature.

A. Human Studies

1. Studies Submitted as/with Comments

No new human studies that meet the criteria for selecting articles to review, which are described in the lipids/cancer proposal, were submitted with comments.

2. Update of the Scientific Literature

Studies that became available after publication of the lipids/cancer proposal are discussed below and described in Table 1.

A new correlational study on cancers of the colon, rectum, prostate, and breast was reviewed (Ref. 92). Incidence rates for these cancers and food consumption data were compared among Chinese in Shanghai, Chinese Americans in San Francisco, and Americans in Connecticut. The study demonstrated that the incidence rates for the four types of cancer were much higher among Americans and Chinese Americans than for Shanghai Chinese and that the Americans and Chinese Americans consumed much more meat and milk products than the Shanghai Chinese. The authors interpreted the results of the study to demonstrate that low fat diets were associated with the lower incidence rates of the four types of cancer found among the Shanghai Chinese. However, because the design of this study allowed correlations to be made only between a population's cancer incidence rates and its per capita food consumption, rather than studying individuals who actually have cancer, inferences cannot be made about the causal nature of diet on risk of cancer. The study was unable to control for important risk factors for these cancers, such as lifestyle factors, family history, reproductive and endocrine factors, total energy intake, and differences in body weight.

A new correlational study that compared dairy fat and lard intake data from 36 countries with cause-specific cancer mortality rates was also reviewed (Ref. 93). World Health Organization (WHO) mortality statistics for 1985–1987 were correlated with intake data obtained from 1979–1981 Food and Agricultural Organization (FAO) food balance sheets. FAO's food balance sheets are approximations of actual consumption and are not separated by age and sex. The authors were able to adjust for total caloric intake but were not able to adjust for potential confounding factors, such as smoking

and family history. The study demonstrated highly significant correlations between intakes of dairy fat or lard fat and mortality from all causes, total cancer, and colon and rectal cancer among both men and women and from lung cancer and prostate cancer for men and breast cancer for women.

a. *Pancreatic cancer.* The agency reviewed two new case-control studies on diet and pancreatic cancer, which were published in 1991 (see Table 1). One study conducted in Poland (Ref. 94) demonstrated no association between risk of pancreatic cancer and total dietary fat or saturated fat. The highest intake of dietary cholesterol measured in the study was associated with a statistically significant relative risk (the incidence of cancer of the exposed group/the incidence of cancer of the unexposed group) of 4.3 for pancreatic cancer. However, the highest intakes of monounsaturated fatty acids and of polyunsaturated fatty acids were associated with statistically significant decreased risks (see Table 1). The second case-control study, which was conducted in the Netherlands, did not analyze for total dietary fat or for saturated fat (Ref. 95). Consumption of eggs was associated with a statistically significant increased risk and daily consumption of vegetables showed a protective effect in this study.

b. *Bladder cancer.* One case-control study on bladder cancer conducted in Spain was reviewed (Ref. 96 and Table 1). An increased risk of bladder cancer was found with dietary saturated fat but not with total fat. The results of this study may be biased by the inclusion of 208 prevalent cases of bladder cancer, approximately half of the cancer cases. Case-control studies usually select incident cases of cancer for participation, which are new cases, i.e., those not previously diagnosed. Prevalent cases are patients who have survived the disease for at least some amount of time and are generally not included in case-control studies of cancer because the traits contributing to their survival may modify potential risk factors of the disease.

c. *Lung cancer.* A prospective cohort study on lung cancer published in 1991 was reviewed (Ref. 97 and Table 1). The cohort consisted of 1,878 men employed by the Western Electric Company in Chicago. The men were 40 to 55 years old in 1958 when enrolled in the study and were followed for 24 years. Dietary information was collected in 1958 and in 1959 when all the men were clinically free of cancer. After adjusting the results for smoking and percent of calories from fat, an increment of dietary cholesterol of 500 mg per day was associated with a relative risk of lung cancer of 1.9.

d. *Breast cancer.* Five new case-control studies on diet and breast cancer were reviewed (see Table 1). One study that examined only postmenopausal breast cancer found no association with dietary fat (Ref. 99). However, the study suffered from low participation rates among both the cases and controls, which prohibits generalization of the study results to the total population.

A case-control study of both premenopausal and postmenopausal breast cancer among Singapore Chinese showed no effect of diet on postmenopausal women (Ref. 100). No effect on breast cancer risk for premenopausal women was found for total fat, for saturated fat, for monounsaturated fatty acids or for cholesterol; polyunsaturated fatty acids demonstrated a protective effect. The median level of dietary total fat consumed on a daily basis was 33 grams (g) for cases and 34 g for controls; total fat intake ranged from 26 g to 41 g in this study. The authors did not adjust the results for total calories.

A French case-control study found limited evidence that fat is associated with breast cancer risk when the results were analyzed by menopausal status (Ref. 101). However, for all women analyzed together regardless of menopausal status, total fat was associated with a relative risk of 1.6, saturated fat was associated with a relative risk of 1.9 and monounsaturated fatty acids were associated with a relative risk of 1.7. Polyunsaturated fatty acids were not associated with risk of breast cancer. The results were not adjusted for total calories; thus, the increased risk associated with the fats may actually be due to a higher caloric intake by the cancer cases. Several food items were associated with an increased risk of breast cancer among all women, including high fat cheese, fruits rich in beta-carotene, and desserts and chocolate.

A case-control study conducted in Moscow found that dietary fat was not associated with risk of breast cancer in either premenopausal or postmenopausal women (Ref. 102). Gram levels of daily total fat intake were not provided. Several nutrients were associated with a protective effect, including polyunsaturated fatty acids, beta-carotene, vitamin C, calcium, and cellulose. Risks associated with food items were not examined in this study.

A large case-control study conducted in Italy examined the risk of breast cancer associated with fat intake from seasonings (Ref. 103). A moderate association was found for total fat seasonings and for butter and oil, but no association was found for margarine. The results were not adjusted for total calories and very limited dietary information was collected.

e. *Colorectal cancer.* Three new studies on colorectal cancer were reviewed (see Table 1). The most informative study of the three was conducted in Majorca (Ref. 104). An increased risk of colorectal cancer was found to be associated with total calories, and, after adjustment for total calories, an increased risk was also associated with cholesterol, protein, and carbohydrates (Ref. 104). A protective effect was demonstrated with fiber from legumes. Colorectal cancer risk was not found to be associated with high consumption of total dietary fats or saturated fats. However, this lack of association between colorectal cancer and dietary fat may be a result of the population's consumption of primarily monounsaturated fatty acids rather than animal fats.

f. *Prostate cancer.* Two additional case-control studies on the association between dietary factors and risk of prostate cancer were reviewed (Refs. 105 and 106 and Table 1). One study conducted in Spain from 1983 to 1987 found that risk of prostate cancer was increased by a diet rich in animal fats but not by a diet rich in vegetable fats (Ref. 105). Also, meat consumption was associated with increased risk, but different types of meat were not significantly linked to prostate cancer. The study did not adjust for total calories; however, the relative risks associated with animal fats and with meat consumption were large enough (see Table 1) that after adjustment for calories the relative risk estimate would most likely remain elevated.

A case-control study of prostate cancer conducted in Utah demonstrated that dietary factors were not associated with risk of prostate cancer among young men (aged 45 to 67 years) (Ref. 106). However, among men aged 68 to 74 years, risk was increased for total calories, and after adjustment for total calories, an increased risk was associated with total fat, protein, and also for monounsaturated fatty acids and polyunsaturated fatty acids. For both age groups, the baseline level of total fat intake was about or less than 66 g per day.

In addition to the studies in Table 1, several review articles on the relationship between dietary fat and cancer were published recently (Refs. 107, 108, 109, and 110). Two of these review articles stated that the evidence for a putative effect of dietary fat on breast cancer risk is based primarily on

international correlational studies, whereas case-control studies and cohort studies have found only weak associations or no association between dietary fat and breast cancer risk (Refs. 107 and 108). Kinlen (Ref. 107) suggests that the international correlations with fat may be a reflection of the effects of calorie restriction in poor countries or over-nutrition in affluent countries during the years of growth which directly influences known risk factors for breast cancer, such as age at menarche and body size.

A recent review on prostate cancer (Ref. 109) stated that, overall, the epidemiology studies on diet and prostate cancer implicate fat as the main dietary component associated with increased risk. Specifically, recent case-control studies are supportive of an association of fat to prostate cancer, whereas cohort studies have shown either an equivocal and no effect.

B. Animal studies

1. Studies Submitted as/with Comments

No new animal studies that meet the criteria for selecting articles to review, which is described in the lipids/cancer proposal, were submitted with comments.

2. Update of the Scientific Literature

FDA reviewed 22 new animal studies dealing with the relationship between dietary fat and cancer that were not available for review in the proposed rule (see Table 2). Dietary fat and mammary tumorigenesis was the subject of nine studies. The role of fat in colon tumorigenesis was evaluated in five studies, while the role of fat in tumorigenesis at pancreas, skin, or lymph were evaluated in two studies for each tumor site. Fat and leukemia or fat and liver tumor was the subject of one report for each tumor site.

a. *Role of total dietary fat.* Six mammary tumor studies examined the effects of total fat on tumorigenesis. Among these, three studies (Refs. 112, 113, and 114) reported a significant association of high dietary fat with the development of mammary tumors. For example, Kumaki and Noguchi (Ref. 112) measured the influence of high dietary fat on the malignant intensity and hormone receptors of 7,12-dimethylbenzanthracene (DMBA)-induced mammary tumor in female rats fed either a low fat (0.5 percent corn oil) or a high fat (20 percent corn oil) diet after DMBA administration. Tumor incidences in the high fat fed group were significantly higher than in the low fat fed group (86 percent versus 46 percent, respectively) and tumors were significantly larger in the high fat fed group than in the low fat fed group (13.9 millimeters (mm) versus 7.9 mm, respectively). In this study, the 0.5 percent corn oil diet provided inadequate linoleic acid (about 0.3 percent by weight) for growth of the mammary tumors. The deficiency of linoleic acid, rather than decreased total fat, could have reduced tumorigenesis.

Cohen et al. (Ref. 113) examined the effects of dietary fat and fiber in the N-nitrosomethylurea (NMU)-induced rat mammary tumor model. The number of tumor-bearing rats and the mean number of tumors per rat were significantly higher in rats fed a high fat diet (23.5 percent corn oil) than in those fed a low fat diet (5 percent corn oil). The latent period was also significantly prolonged in the low fat fed group. The diets used by Cohen et al. were not isocaloric and body weights were significantly lower in the 5 percent corn oil group from weeks 11 to 15 of the study. Therefore, the results could have been caused by differences in energy intake rather than fat per se.

Gonzalez et al. (Ref. 114) studied the effects of different amounts and types of fat on the growth of human breast carcinoma in athymic nude mice. They reported that a diet with 20 percent corn oil by weight significantly elevated the volume of transplanted mammary tumors (estrogen-dependent MDA–MB231 and nonestrogen-dependent MCF–7) in mice, compared to effects of a diet containing 5 percent corn oil. Diets used in this study were not isocaloric and the differential intakes among groups confound an attribution of the dietary fat to the results per se. The MDA–MB23 cell line was estrogen-dependent and estrogen provided in the drinking water and implanted pellets may have affected tumor growth in these groups.

Studies by Zhu et al. (Ref. 115), Aksoy et al. (Ref. 116), and Khoo et al. (Ref. 117) reported no association between dietary total fat and tumorigenesis in rodents. Zhu et al. (Ref. 115) measured the effect of total dietary fat and dietary energy restriction on growth of methylnitrosourea (MNU)-induced mammary tumorigenesis in female rats. When the diets were isocaloric (50 kilocalories (kcal) per day or 35 kcal per day), tumor yield (number or weight) was not different between the two diet groups (45 percent fat diet by energy and 25 percent fat diet by energy). In this study, diets differed in the provision of linoleic acid: The 25 percent fat diet provided about 1.7 percent linoleic acid by weight. This amount was most likely inadequate for tumor growth.

Aksoy et al. (Ref. 116) attempted to identify effects of different levels of dietary fat on MNU-induced rat mammary tumorigenesis. These authors reported no difference in the incidence, yield, or mortality among groups fed diets containing 12 percent, 25 percent, and 45 percent fat by energy. The 12 percent or the 25 percent fat diets (which provided about 0.7 percent or 1.9 percent linoleic acid by weight) may not have provided adequate linoleic acid for tumor growth. In this study, rats consumed the same amount of calories, and body weights were not different among groups even though the experimental diets were not isocaloric.

Khoo et al. (Ref. 117) tested the anticancer effect of dietary stearic acid. In this study, mammary tumors were induced by NMU and cultured in vitro. The cultured, tumor cells were implanted in the flank of rats. Rats were fed either a powdered control diet or a diet containing 20 percent stearic acid by weight. Feeding was continued for 6 weeks before and 25 days after tumor implantation. The stearic acid-supplemented diet did not affect the growth (size or weight) of the transplanted tumors. The adequacy of dietary linoleic acid for tumor growth in this study cannot be determined because the fatty acid composition in the diet was not reported.

Six new studies examined the effects of dietary fat on development of chemically-induced colon tumors in rodents. Two studies measured the effect of total fat (Refs. 118 and 119). Nicholson et al. (Ref. 118) measured the influence of dietary fat (beef suet, rich in saturated fats and corn oil, rich in linoleic acid) on colorectal tumorigenesis. Wistar rats were fed diets containing 5 percent or 20 percent fat (beef suet or corn oil) by weight. The 5 percent beef suet diet significantly reduced azoxymethane-induced colon adenocarcinoma compared to the 20 percent beef suet diet (12 carcinomas versus 28 carcinomas, respectively, in the 5 percent and 20 percent beef suet groups). The difference in tumor yield between the 5 percent corn oil and 20 percent corn oil diets was not statistically significant (1 carcinoma versus 2 carcinomas, respectively, between the 5 percent and 20 percent corn oil groups). The beef suet diets provided limited linoleic acid (0.6 percent to 1 percent).

Behling et al. (Ref. 119) measured the effects of varying levels of dietary calcium and butter fat on lipid utilization and development of colon tumors in dimethylhydrazine dihydrochloride (DMH)-initiated rats. These authors found no difference in

intestinal tumors in rats fed either a diet with 5 percent butter fat plus 1 percent corn oil or a diet with 20 percent butter fat plus 1 percent corn oil. The experimental diets provided limited linoleic acid (about 0.6 percent by weight), and this may have decreased the possibility of identifying effects of total dietary fat.

Hietanen et al. (Ref. 120) measured modulation by quantity and degree of saturation of dietary fat of oxidative stress and chemically-induced liver tumors in rats. These authors found a significantly increased incidence of liver tumors in rats fed a diet containing high levels of polyunsaturated fatty acids (PUFA; 25 percent sunflower seed oil by weight) compared to rats fed a diet containing low concentrations of polyunsaturated fatty acids (2 percent sunflower seed oil by weight). Tumor incidences were 80 percent versus 42 percent for groups fed 25 percent or 2 percent sunflower seed oil, respectively. The 2 percent PUFA diet in this study provided about 1.6 percent linoleic acid, which may not have been adequate for tumor growth. Body weight changes were not significantly different among groups, although diets were not isocaloric.

Smith et al. (Ref. 121) measured the effects of a high fat diet and a CCK-receptor antagonist on growth of a human pancreatic tumor cell line in nude mice. In this study, a high fat diet (20.3 percent fat by weight: 4.3 percent chow fat plus 16 percent corn oil) significantly increased tumor volume and protein content compared to values for tumors from mice fed a chow diet. Fatty acid composition of the chow diet was not reported. However, the chow diet may not have provided adequate linoleic acid for tumor growth, and a limitation of linoleic acid, rather than low total fat, could have reduced tumor growth.

Longnecker et al. (Ref. 122) studied the development of pancreatic neoplasms in elastase-1-simian virus transgenic mice. The authors reported no difference in incidence of tumor between groups of mice fed a 5 percent corn oil diet or a 20 percent corn oil diet. The applicability of the results of this study in genetically transformed mice to human cancer studies is not clear.

Thus, among the 11 studies that examined the effect of dietary fat on tumorigenesis, 6 studies (3 mammary tumor studies, 1 colon tumor study, 1 pancreatic tumor study, and 1 liver tumor study) reported significant reductions in the risk of tumorigenesis, measured by incidence, multiplicity, or latency, by reducing fat intakes from about 20 percent to about 5 percent. However, the evaluation of the studies was difficult because many studies suffered a critical and a common limitation in the methodology: diets were limited in linoleic acid, which is necessary for optimal tumor growth.

b. *Effects of types of fat.* Four studies examined the effects of different types of fat on mammary tumorigenesis (Refs. 117, 123, 124, and 125). All four studies reported inconsistent or insignificant effects of different types of fat.

Buckman et al. (Ref. 123) studied whether oleate influences the linoleate-enhanced metastasis of murine mammary tumors. Diets contained 13.5 percent to 61 percent linoleic acid and 12 percent to 47 percent oleic acid. Total fat was 20 percent by weight. Diets did not significantly affect latent period, incidence, or yield of tumors. These diets provided adequate linoleic acid for optimal tumor growth at the mammary gland. The authors reported that a low linoleic acid to low oleic acid diet reduced lung metastasis compared to the other three diets (low linoleic acid to high oleic acid, high linoleic acid to moderate oleic acid, and high linoleic acid to low oleic acid). Values were 10 nodules, 62 nodules, 78 nodules, and 90 nodules, respectively, for mice fed these four diets. The low linoleic acid to low oleic acid suppressed tumorigenesis, in terms of metastasis, in lung but not in liver.

Lasekan et al. (Ref. 124) fed rats diets with 20 percent fat by weight and examined DMBA-induced mammary tumorigenesis. The concentrations of linoleic acid and oleic acid, respectively, in the dietary fat were 72.9 percent and 12.4 percent linoleic acid-rich safflower oil diet (SL diet), 17.2 percent and 71.1 percent safflower oil diet (SO diet), 5.6 percent and 6.7 percent olive oil diet (OO diet), and 16.9 percent and 67.9 percent linoleic acid-rich olive oil diet (OL diet). The concentrations of linoleic acid in the diets were 14.6 percent (SL diet), 3.4 percent (SO diet), 1.1 percent (OO diet), and 3.4 percent (OL diet) by weight. Dietary concentrations of linoleic acid, oleic acid, or linoleic acid to oleic acid ratio did not consistently affect latent period, incidence, or yield of mammary tumors. The OO diet showed a significant tumor-lowering effect, which disappeared when linoleic acid was added. Tumors per rat were 3.0, 5.1, 3.5, and 5.0 in rats fed the OO, OL, SL, and SO diet, respectively. Because the OO diet was limited in linoleic acid, the findings support the "about 4 percent linoleic acid requirement" for mammary tumorigenesis in rodents (Refs. 20 and 71).

Khoo et al. (Ref. 117) also showed that 20 percent supplementation of stearic acid to a control diet did not affect mammary tumor growth in rats. Fatty acid composition of the control diet was not reported for this study, and the adequacy of linoleic acid content cannot be determined. Hirose et al. (Ref. 125) also reported no difference in mammary tumor yields between the 10 percent soybean oil group and the 10 percent safflower oil group. Both of these diets contained sufficient linoleic acid for optimal tumor growth.

Three studies (Refs. 118, 125, and 126) examined the effects of different types of fat on colon tumorigenesis. One study (Ref. 118) reported that a diet containing 20 percent beef suet produced significantly more tumor than a diet containing 20 percent corn oil (28 carcinoma versus 2 carcinoma, respectively). The 5 percent beef suet diet also elevated tumor yield compared to the 5 percent corn oil diet (12 carcinoma versus 1 carcinoma, respectively). The beef suet diets, although providing limited linoleic acid, nevertheless increased colon tumor development. The findings suggest that the effects of saturated fatty acids (SFA) may be promoting and those of polyunsaturated fatty acids (PUFA) may be protective for colorectal tumorigenesis.

Conversely, Nutter et al. (Ref. 126) measured the effects of dietary fat and protein on DMH-induced tumor development and immune responses in male mice. These authors reported that 4.7 percent beef tallow (BT) diets were protective for colon tumorigenesis in mice compared to 4.7 percent corn oil (CO) diets (3.2 tumor per tumor-bearing mouse versus 12.3 tumor per tumor-bearing mouse, BT versus CO, respectively). This study suffers limitations in methodology: the total fat level, 4.7 percent, was too low, and the beef tallow diet was limited in content of linoleic acid (about 0.3 percent by weight).

The other study by Hirose et al. (Ref. 125) reported that incidence or yield of experimental tumorigenesis at the colon was not different between the 10 percent soybean oil group and the 10 percent safflower oil group in rats. The diets provided adequate linoleic acid for optimal tumor growth.

Two studies on skin tumors (Refs. 127 and 128) were also reported. Locniskar et al. (Ref. 127) compared the effects of fish, coconut, and corn oils on skin tumors induced by DMBA and benzoylperoxide in mice. Leyton et al. (Ref. 128) measured the effects of different types of dietary fat on DMBA- and phorbolester (12–O-

tetradecanoylphorbol-13-acetate, TPA)-elicited tumorigenesis at mouse skin. Both studies found a significant protective effect of PUFA (corn oil) and a significant promoting effect of SFA (coconut oil) on skin tumorigenesis. In both of these studies, diet groups with the highest dietary corn oil (15 percent by weight in one study and 10 percent by weight in the other study as the sole fat source) showed the lowest yield of papilloma (3.4 tumors versus 11.7 tumors, 1 percent CO versus 15 percent CO in SENCAR mice) or carcinoma. The results differ from the "about 4 percent linoleic acid requirement" for optimal tumorigenesis for mammary tumorigenesis in rodents (Refs. 129 and 130) and suggest that the linoleic acid requirement may be different for tumors at different sites.

The results of the recently reported studies show that, when the requirement of linoleic acid for optimal tumor growth is met, types of dietary fat do not have specific effects on tumorigenesis of the mammary gland. The study results on colon tumor are equivocal: dietary PUFA was promoting in one study and was protective in the other. The two studies in skin tumor consistently reported a protective role of dietary PUFA, which suggests a different level of linoleic acid requirement for tumorigenesis at different sites.

c. *Fat intake versus energy intake.* Because energy intake and fat intake are highly correlated, it is possible that the association between dietary fat and cancer is confounded by energy intake. It also has been demonstrated in animal and human studies that energy intake in excess of an essential requirement is of primary importance in determining the incidence of induced and spontaneous tumors. During the preparation of the proposal on the lipids and cancer health claim, FDA carefully reviewed studies with isocaloric diets or similar energy provisions. The agency reached the tentative conclusion that the totality of the evidence from both animal and human studies showed that the effect of dietary fat on tumorigenesis is independent of the effect of energy (Refs. 11, 17, and 23).

Two new animal studies examined the relationship between fat and cancer with isocaloric diets or similar energy provisions (Refs. 115 and 116). One study (Ref. 115) reported that calorie restriction, rather than fat content, significantly reduced tumor growth in this study. Another study by Aksoy et al. (Ref. 116) reported no difference in the growth of mammary tumors among 12 percent, 25 percent, and 45 percent fat-fed groups. However, both of these negative studies suffered from the same methodological problem: diets were limited in linoleic acid (about 1.7 percent linoleic acid in one study and about 0.7 percent to 1.9 percent linoleic acid in the other). Because of this common limitation that linoleic acid in the diet was not sufficient for optimal tumor growth, the studies cannot be adequately evaluated for the effect of fat on cancer. In conclusion, although the newly reported studies were not adequate to evaluate the energy-independent effect of fat on cancer development, from several studies previously reviewed, the agency found adequate evidence to conclude that the effect of fat is independent of the effect of energy.

d. *Omega-3 fatty acids and fish oil.* In one study (Ref. 125), mammary tumor was induced by dimethylbenzanthracene and dimethylhydrazine, and the effects of perilla oil (an omega-3 fatty acid rich plant seed oil), soybean oil, and safflower oil were tested at 10 percent by weight. Incidence rates were not different among groups but the tumor yield was significantly lowered by perilla oil feeding, compared to soybean oil or safflower oil feeding (4.4 tumors, 6.5 tumors, and 5.7 tumors per rat: perilla oil, soybean oil, and safflower oil, respectively). Perilla oil is rich in linoleic acid (13.7 percent) compared to soybean and safflower oils, which contain 1.7 percent and 0.1 percent linoleic acid, respectively. Perilla oil is also relatively low in linoleic acid (15.9 percent) compared to soybean and safflower oils, which contain 52.6 percent and 74 percent linoleic acid, respectively. This study suffers the common methodological limitation in that perilla oil diet containing about 1.6 percent linoleic acid may have provided inadequate linoleic acid for tumor growth.

One recent study on colon tumorigenesis (Ref. 129) also reported a protective effect of omega-3 fatty acid. In this study, mice were fed a 19.2 percent fat diet with various sources: beef tallow, soybean oil, and a commercial fish oil product (MaxEPA). The MaxEPA diet significantly lowered and the beef tallow diet significantly elevated the yield of adenocarcinoma of the colon, compared to other groups (mean tumor per animal was 1.23 mean tumor, 0.47 mean tumor, and 0.23 mean tumor for the beef tallow, soybean oil, and fish oil group, respectively). Diets provided adequate linoleic acid for optimal tumor growth. This result suggests that the high fish oil diet (MaxEPA) may have a protective role in dimethylhydrazine-induced colon tumorigenesis in Swiss-Webster mice.

Another study (Ref. 125) found an inconsistent effect of different types of fat on tumorigenesis at the colon. A 10 percent perilla oil diet significantly lowered incidence of colon tumors compared to a 10 percent soybean oil diet or a 10 percent safflower oil diet in rats. Tumor incidences were 4 percent, 9 percent, or 9 percent for the perilla oil, soybean oil, or safflower oil diets, respectively. Tumor yield was not different among groups. In this study, the perilla oil diet provided about 1.6 percent linoleic acid by weight, which might have been limiting for optimal tumor growth.

There were two lymphoma studies (Refs. 130 and 131), which showed an adverse effect of omega-3 rich fatty acid on tumorigenesis. Both studies used AKR mice and examined the growth of xenograft lymphoma. The composition of dietary fat tested were fish oil versus beef tallow in one study and fish oil versus hydrogenated beef tallow in the other. Diets in both of these studies were severely limited in linoleic acid (0.01 percent to 0.48 percent by weight in one study and 0.004 percent to 0.18 percent by weight in the other study). Due to this methodological problem, the results are not useful for evaluating the effect of fat.

Hence, results of the recently reported studies are contradictory for the effect of omega-3 fatty acid on tumor development. One (Ref. 129) of the four studies studied the development of colon tumor with an adequate linoleic acid provision in the diet. In this study, the fish oil (MaxEPA) at 19.2 percent by weight significantly reduced tumor yield. The study, however, suffers from the limitation that the amount of dietary fish oil used was impractically high. Overall, the recent studies failed to adequately refute or support the effects of fish oil on tumorigenesis. Further studies are required to elucidate the effects and mechanism of omega-3 fatty acids on tumorigenesis.

e. *Mechanisms of carcinogenesis.* Although several mechanisms have been proposed, the biochemical mechanism by which fat affects tumorigenesis has not been definitely established. As discussed in the lipids/cancer proposal, hypotheses include fat-induced alteration in membrane peroxidation, immune function, gene expression, metabolism of chemical carcinogens, metabolism of hormones, metabolism of eicosanoids, and turnover rate of intestinal mucosal cells (56 FR 60764). Recent studies have not further elucidated the mechanisms for the effect of fat on tumorigenesis.

After reviewing the animal studies, Schatzkin et al (Ref. 132) concluded that increasing the amount of dietary fat increases mammary tumorigenesis, whether measured in terms of incidence, multiplicity, or latency; the production of tumors is enhanced when a high level of fat is fed after, not before, initiation, suggesting a promotional effect of dietary fat; the tumor-enhancing effects of high levels of saturated or polyunsaturated fat are similar when the diets contain a minimal amount of polyunsaturated fat to provide essential fatty acids; and that dietary fat and total calorie intake seem to have separate tumor enhancing effects.

On the other hand, Kritchevsky (Ref. 133) noted that all of the studies relating to fat and experimental carcinogenesis show that increasing levels of dietary fat increases tumor incidence; the effect seems to be exerted principally in the promotion phase and plateaus at between 5 and 10 percent of fat in the diet; and energy from the fat-rich diets, rather than fat per se, may be the factor enhancing tumorigenesis. He concluded that:

> The possibility that the problem may be energy rather than fat permits us to make broader dietary choices without excluding specific nutrients. * * * The call for reductions in fat intake to 15 percent or 20 percent of energy may be considered drastic, but a modest reduction (perhaps to 30 percent of energy) might not be out of order.

Another comprehensive review of studies (Ref. 134) reached conclusions similar to those of Kritchevsky. The authors concluded that:

> High dietary fat (20 percent by weight or 40 percent by energy) significantly elevates incidence and multiplicity of mammary gland tumors induced chemically in rodents. High dietary total fat also clearly promotes tumorigenesis at the colon and pancreas. On the other hand, moderate to severe dietary restriction in animals yields fewer neoplasms, particularly in the mammary gland. Intake of a high-fat diet even at moderate restriction would not lead to promotion because the dietary restriction would have the opposite effect. This finding could obviously be transformed to humans. However, most human populations do not voluntarily undergo lifelong dietary restriction but rather eat ad libitum.

Therefore,

> A diet which is high in complex carbohydrate (65 percent to 70 percent by energy) and moderate in fat (20 percent to 25 percent) and protein (10 percent to 15 percent) would be recommended.

C. Conclusions About New Evidence

The agency has reviewed several new research articles, and several review papers, which were published since the proposal. Among the human studies, one correlational study was supportive of the hypothesis that high fat diets increase the risk of cancers of the colon, rectum, prostate and breast (Ref. 92), and another correlational study supported the relationship between increased cancer risk and dairy fat and lard fat (Ref. 93). A new case-control study on pancreatic cancer was consistent with the earlier reports that this cancer is not associated with dietary fat (Refs. 94). A study on bladder cancer suggested that an increased risk was associated with saturated fat but not with total fat (Ref. 96).

The results of several new human case-control studies on breast cancer demonstrated no effect of total dietary fat on postmenopausal breast cancer risk (Refs. 99, 100, and 102). Moreover, the evidence for an effect of dietary fat on premenopausal risk was extremely limited in the new studies reviewed, and the study that found an increased risk associated with fat for all women (not separated by menopausal status) did not adjust for total calories (Ref. 101). The case-control studies on breast cancer which examined associations with food found increased risks from total food (Ref. 101) and from fats used as seasonings (Ref. 103), but not from meat (Ref. 101).

However, for a number of reasons, case-control studies are at a disadvantage compared to correlational studies in their ability to detect an association between dietary fat and cancer risk. The range of dietary fat intake is usually narrow in case-control studies because the populations studied are homogenous in terms of dietary parameters. It is extremely difficult for an epidemiology study to detect an increase in cancer risk associated with dietary fat when the difference in fat intake between cases and controls is minimal. Also, the average fat content of the diet in Western countries is seldom less than 30 percent to 35 percent of total calories. Although it is not known for certain how low the fat content of a diet needs to be before a reduction in cancer risk is achieved, it is at least less than 30 percent of total calories. Thus, it is not surprising that the results of case-control studies investigating the relation between dietary fat and cancer are often equivocal.

A new study on colorectal cancer did not demonstrate an increased risk associated with total dietary fat or saturated fat but did show an increased risk with total calories and with cholesterol (Ref. 104). Two new case-control studies on prostate cancer both found an increased risk associated with dietary fat (Refs. 105 and 106).

The evidence from the new animal studies generally supports the conclusion drawn in the lipids/cancer proposal that dietary total fat is associated with the risk of cancer. Among eleven animal studies, six studies (three in mammary tumor, one in colon tumor, one in pancreatic tumor, and one in liver tumor) reported significant reductions in the risk of tumorigenesis, measured by incidence, multiplicity, or latency, by reducing fat intakes from about 20 percent to about 5 percent.

Regarding types of fat, the new studies provide the same conclusion as the one that the agency drew in the proposal: currently, there is not enough evidence to delineate specific roles of different types of fat on tumorigenesis. The new studies show that when the requirement of linoleic acid for optimal tumor growth is met, various types of dietary fat do not affect tumorigenesis at the mammary gland differently. The study results on colon tumor are equivocal; dietary PUFA was promoting in one study and was protective in the other. The two studies on skin tumor consistently reported a protective role of dietary PUFA, which suggests a different level of linoleic acid requirement for tumorigenesis at different sites.

It is difficult to disassociate the effect of fat from the effect of total energy. The two new animal studies did not provide further evidence that dietary fat has an energy-independent effect on carcinogenesis. There are two new studies that utilized isocalorie or similar calorie provisions (Refs. 115 and 116). One of these studies reported that energy intake rather than fat intake affects cancer development. However, both studies suffered the common methodologic limitation that linoleic acid in the diet was insufficient and were not adequate to evaluate the effect of fat. However, several studies previously reviewed by the agency (Refs. 11, 17, and 23) provided adequate evidence to conclude that the effect of fat is independent of the effect of energy.

As was the case with studies reviewed in the proposal, new studies on omega-3 fatty acid and tumor development do not provide conclusive evidence. Among the four new studies of omega-3 fatty acid and cancer, only one study (Ref. 129) in colon tumor provided adequate linoleic acid in the diet. The fish oil (MaxEPA) at 19.2 percent by weight significantly reduced tumor yield, suggesting that the fish oil may reduce DMH-induced colon tumor risk. The study, however, suffered from the limitation that the amount of dietary

fish oil used was unpractically high. Additional studies are required to elucidate the effects and mechanisms of omega-3 fatty acids on tumorigenesis.

The new studies reviewed did not further elucidate the mechanisms for the effect of fat on tumorigenesis. The existing hypotheses include alterations in membrane peroxidation, membrane fluidity and microenvironment, immune function, gene expression, metabolism of chemical carcinogens, metabolism of hormones, metabolism of eicosanoids, and turnover rate of intestinal mucosal cells (as discussed in the lipids/cancer proposal).

Thus, new animal studies provide some, although inconclusive, evidence that dietary total fat is associated with risk of some cancers. Mammary tumor, colon tumor, pancreatic tumor, and liver tumor may be affected. Evidence is inconclusive regarding specific roles of different types of fat including fish oils. The evaluation of the new studies was greatly hampered by the common limitation in the experimental design of limited linoleic acid in the diet.

As discussed previously in this preamble, several comments suggested that FDA drop the specification of types of cancer affected from the health claim. In view of the new evidence, FDA believes that the scientific evidence on lipids and risk of specific cancers is not as yet definitive. Further evidence has to be accumulated to draw clear conclusions regarding effects of different types of fat, effects at different tumor sites, effects of omega-3 fatty acids, the quantitative relationship between fat and energy, and mechanisms by which fat affects cancer development. Methodological limitations in the human and animal studies on dietary lipids and cancer are discussed in the lipids/cancer proposal and elsewhere in this document.

In conclusion, the evidence found in the new studies in humans and animals supports the agency's tentative conclusion in the proposal that the totality of publicly available scientific evidence supports an association between dietary fat and cancer risk. Evidence is also accumulating that total energy intake is an additional risk factor for cancer. However, the evidence for which types of cancer are affected is equivocal. Therefore, the agency is not authorizing the phrase "particularly cancers of the colon, breast, and prostate" or any other site to be included in the health claim.

IV. Environmental Impact

FDA has determined that under 21 CFR 25.24(a)(11), this action is of a type that does not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

V. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

List of Subjects in 21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 101 is amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. New § 101.73 is added to subpart E to read as follows:

§ 101.73 Health claims: dietary fat and cancer.

(a) *Relationship between fat and cancer.* (1) Cancer is a constellation of more than 100 different diseases, each characterized by the uncontrolled growth and spread of abnormal cells. Cancer has many causes and stages in its development. Both genetic and environmental risk factors may affect the risk of cancer. Risk factors include a family history of a specific type of cancer, cigarette smoking, alcohol consumption, overweight and obesity, ultraviolet or ionizing radiation, exposure to cancer-causing chemicals, and dietary factors.

(2) Among dietary factors, the strongest positive association has been found between total fat intake and risk of some types of cancer. Based on the totality of the publicly available scientific evidence, there is significant scientific agreement among experts, qualified by training and experience to evaluate such evidence, that diets high in total fat are associated with an increased cancer risk. Research to date, although not conclusive, demonstrates that the total amount of fats, rather than any specific type of fat, is positively associated with cancer risk. The mechanism by which total fat affects cancer has not yet been established.

(3) A question that has been the subject of considerable research is whether the effect of fat on cancer is site-specific. Neither human nor animal studies are consistent in the association of fat intake with specific cancer sites.

(4) Another question that has been raised is whether the association of total fat intake to cancer risk is independently associated with energy intakes, or whether the association of fat with cancer risk is the result of the higher energy (caloric) intake normally associated with high fat intake. FDA has concluded that evidence from both animal and human studies indicates that total fat intake alone, independent of energy intake, is associated with cancer risk.

(b) *Significance of the relationship between fat intake and risk of cancer.* (1) Cancer is ranked as a leading cause of death in the United States. The overall economic costs of cancer, including direct health care costs and losses due to morbidity and mortality, are very high.

(2) U.S. diets tend to be high in fat and high in calories. The average U.S. diet is estimated to contain 36 to 37 percent of calories from total fat. Current dietary guidelines from the Federal Government and other national health professional organizations recommend that dietary fat intake be reduced to a level of 30 percent or less of energy (calories) from total fat. In order to reduce intake of total fat, individuals should choose diets which are high in vegetables, fruits, and grain products (particularly whole grain products), choose lean cuts of meats, fish, and poultry, substitute low-fat dairy products for higher fat products, and use fats and oils sparingly.

(c) *Requirements.* (1) All requirements set forth in § 101.14 shall be met.

(2) Specific requirements. (i) *Nature of the claim.* A health claim associating diets low in fat with reduced risk of cancer may be made on the label or labeling of a food described in paragraph (c)(2)(ii) of this section, provided that:

(A) The claim states that diets low in fat "may" or "might" reduce the risk of some cancers;

(B) In specifying the disease, the claim uses the following terms: "some types of cancer" or "some cancers";

(C) In specifying the nutrient, the claim uses the term "total fat" or "fat";

(D) The claim does not specify types of fat or fatty acid that may be related to the risk of cancer;

(E) The claim does not attribute any degree of cancer risk reduction to diets low in fat; and

(F) The claim indicates that the development of cancer depends on many factors.

(ii) *Nature of the food.* The food shall meet all of the nutrient content requirements of § 101.62 for a "low fat" food; except that fish and game meats (i.e., deer, bison, rabbit, quail, wild turkey, geese, ostrich) may meet the requirements for "extra lean" in § 101.62.

(d) *Optional information.* (1) The claim may identify one or more of the following risk factors for development of cancer: Family history of a specific type of cancer, cigarette smoking, alcohol consumption, overweight and obesity, ultraviolet or ionizing radiation, exposure to cancer-causing chemicals, and dietary factors.

(2) The claim may include information from paragraphs (a) and (b) of this section which summarize the relationship between dietary fat and cancer and the significance of the relationship.

(3) The claim may indicate that it is consistent with "Nutrition and Your Health: Dietary Guidelines for Americans," U.S. Department of Agriculture (USDA) and Department of Health and Human Services (DHHS), Government Printing Office.

(4) The claim may include information on the number of people in the United States who have cancer. The sources of this information must be identified, and it must be current information from the National Center for Health Statistics, the National Institutes of Health, or "Nutrition and Your Health: Dietary Guidelines for Americans," USDA and DHHS, Government Printing Office.

(e) *Model health claims.* The following model health claims may be used in food labeling to describe the relationship between dietary fat and cancer:

(1) Development of cancer depends on many factors. A diet low in total fat may reduce the risk of some cancers.

(2) Eating a healthful diet low in fat may help reduce the risk of some types of cancers. Development of cancer is associated with many factors, including a family history of the disease, cigarette smoking, and what you eat.

Dated: October 30, 1992.

David A. Kessler,

Commissioner of Food and Drugs.

Louis W. Sullivan,

Secretary of Health and Human Services.

Note: The following tables will not appear in the annual Code of Federal Regulations.

BILLING CODE 4160-01-F

Study	Study Design	Subjects	Methods
Zatonski et al., 1991 (Ref. 94)	Case-Control; Poland; Pancreatic (Exocrine) Cancer; study conducted 1985 to 1988	110 cases (surrogates interviewed for 71%); 195 controls (all directly interviewed)	Interview using diet questionnaire contai food items; diet ass to 2 years before interview; 43% of ca were histologically confirmed and remain diagnosed radiologic
de Mesquita, et al., 1991 (Ref. 95)	Case-Control; Netherlands; Pancréatic (Exocrine) Cancer; study conducted 1984 to 1988	164 cases (surrogates interviewed for 50% males and 46% females); 480 controls (surrogates interviewed for 34% males and 26% females)	Interview using diet questionnaire contai 116 food items; diet assessed 1 year befo interview; 68% of ca were histologically confirmed; others di clinically
Riboli, et al., 1991 (Ref. 96)	Case-Control; Spain; Bladder Cancer; Study conducted 1985 to 1986	432 cases (all males); 792 controls; 2 sets of controls: population-based and hospital-based	Interview using diet questionnaire contai food groups; diet as 1 year before interv all cases histologic confirmed
Shekelle, et al., 1991 (Ref. 97)	Prospective Cohort; Western Electric Co. employees, Chicago; Lung Cancer	1,878 men aged 40 to 55 years in 1958 followed 24 years	Dietary information foods and beverages consumed preceding collected at exam 1 exam 2, 1 year late clinically free of

TABLE 1
er: Human Studies 1991 to Present

	Results	Comments
dietary containing 80 t assessed 1 re of cases ally emainder logically	Adjusted for smoking and total calories: Total fat: RR=0.3 (0.1-1.0) SFA: RR=0 3 (0.1-1.0) MUFA: RR=0.1 (0.3-0.6) PUFA: RR=0.2 (0.1-0.6) Cholesterol: RR=4.3 (1.6-11 6)	Only cholesterol showed a positive relation with pancreatic cancer; substantial use of proxy interview of cases introduces bias: median daily total fat intake was 113 g for cases and 105 g for controls
dietary containing diet before of cases ally rs disgnosed	Adjusted for smoking and total calories: Oil and Fats: RR=1.1 for highest quintile (NS) Total meat: RR=1.6 for highest quintile (NS) Cheese: RR=0.8 (NS) Milk: RR=0.8 (NS) Eggs: RR=2 3 snd daily consumption of vegetables RR=0.3 for highest quintile (statistical significsnce and test for trend significance for both)	Total fat and saturated fat not snalyzed in this study; consumption of eggs is associated with a statistically significant increased risk and daily consumption of vegetables show a protective effect: large percentage of proxy interview of cases may introduce bias
g dietary containing 60 iet assessed interview; logically	Adjusted for smoking and total calories: Total Fat: No association Saturated Fat: RR=2.2 (1.4-3.6) for highest quintile and trend highly significant (p=.0005) PUFA, MUFA: No associations Cholesterol: RR=1.4 (0.9-2.2) P/S Ratio: RR=0.7 (0.5-1.0)	Increased risk associated only with saturated fat; no association with total fat. Mean daily total fat intake was 99 g for cases and 95 g for controls Slightly low participation rates (cases: 72%; controls: 71% hospital and 66% population); results possibly biased by inclusion of 208 prevslent cases because they are survivers
ation on rages ding 28 days xam 1 and later (all e of cancer)	Adjusted for smoking and percent calories from fat: Dietary Cholesterol: 605-794 mg/day RR=1.3 795+1,909 mg/day RR=1.9 (results similar when adjusted for energy intake) Multivariable model implicated cholesterol from eggs but not from other sources	Increment of dietary cholesterol of 500 mg/day associated with RR=1.9 (1 1-3.4) Followup data not available so cannot assess changes in dietary cholesterol after baseline measurement

	Results	Comments
ietary 172 foods: ears all cases ly s adjusted n, age at number of at s with nign nd	Cases and controls consumed same calories. No association found between breast cancer risk and total fat or saturated fat: Fat RR= 0.9 (0.6-1.4); SFA RR=1.0 (0.7-1.5). Dietary carotene, vitamin C protective but no effect shown for supplement use; dietary fiber borderline protective RR=0.7 (0.5-1.1); adjustment for total calories did not change results	No association found between breast cancer risk and dietary fat. Mean daily total fat consumption was 82 g for cases and 83 g for controls. Low participation rates may introduce bias: 56% of eligible cases and 46% of eligible controls participated in study, thus results may not be generalizable to total population
ietary 90 foods; ear before ses were nfirmed; for age of first pausal , height, arity, breast nopausal	Postmenopausal women: no significant effects for any dietary variable Premenopausal women: Total fat, SFA, MUFA, and cholesterol showed no significant effect; P/S Ratio: RR=0.4 (0.2-0.8); Decreased risks found for PUFA: RR=0.5 (0.3-0.8); increased risk found for red meat after controlling for all other dietary variables: RR=4.0 (1.9-8.5)	Results not adjusted for total calories. No effect of diet on postmenopausal women. No effect found for total fat, SFA, MUFA, cholesterol and protective effect found for PUFA on premenopausal women. Median daily fat consumption was 33 g for cases and 34 g for controls. Hospital controls may have misrepresented their usual diet if preclinical symptoms (1 year before interview) affected diet
ietary 55 foods; ssed, but ast 12 et was ere nfirmed; for age, , family cancer, breast age at	Multivariate Model: All women: Fat 1.6 (1.1-2.2) SFA 1.9 (1.3-2.6) MUFA 1.7 (1.2-2.5); PUFA, cholesterol no significant effects Premenopausal women: MUFA 2.0 (1.1-3.7) SFA, MUFA, retinol, beta-carotene, fat, vitamin E no significant effects Postmenopausal women: SFA: 2.0 (1.2-3.1) Retinol: 2.8 (1.2-2.8) Total fat, MUFA, beta-carotene, vitamin E no significant effects Food Associations (all women): Total Food RR=1.7 (1.1-2.4); High fat cheese RR=1.4 (1.0-1.9); Desserts and chocolate RR=1.7 (1.2-2.5); Meat, Olive Oil, Nuts - nonsignificant	Results not adjusted for total calories or for body size. Limited evidence that fat is associated with breast cancer risk when analyzed by menopausal status. Total food was positively associated. Use of hospital controls could lead to selection of controls whose diseases are associated with high fat diets, although study excluded cardiovascular disease controls

Study	Study Design	Subjects	Methods
Zarídze, et al., 1991 (Ref. 102)	Case-Control; Moscow; Pre- and postmenopausal Breast Cancer; Study conducted 1987 to 1989	139 incident cases (58 premenopausal and 81 postmenopausal); 139 clinic controls (54 premenopausal and 85 postmenopausal) matched by age and neighborhood	Dietary questionnaire 145 food items; diet assessed for average consumption during yea prior to diagnosis for cases and for year pri interview for controls Data analyzed for pre- postmenopausal women separately. Adjusted total energy for all analyses; weight, heig and Quetelet's index w assessed but none had significant effect so results were not adjus for these variables
D'Avanzo, et al., 1991 (Ref. 103)	Case-Control; Italy; Pre- and postmenopausal Breast Cancer; Study conducted 1983 to 1989	2,663 incident cases (1,122 premenopausal and 1,541 postmeno- pausal); 2,344 controls (884 premenopausal and 1,460 postmenopausal)	Dietary questionnaire few selected indicator foods to obtain data o intake in seasonings (butter, margarine and oil); current diet assessed; all cases histologically confirm results adjusted for a area of residence, education, history of benign breast disease, family history of brea cancer, nulliparity, a first birth, age at menarche, menopausal status, age at menopau body mass index, oral contraceptive and othe female hormone use
Benito, E., et al., 1991 (Ref. 104)	Case-Control; Majorca; Colorectal Cancer; Study conducted 1984 to 1988	286 incident cases; 295 population controls and 203 hospital (ophthalmology and orthopedic); controls matched to cases by age and sex	Interview using dietar questionnaire on 99 fo items; diet assessed year preceding interv all cases histological confirmed; results adj for total calories and age, sex, estimated we 10 years prior to interview, number of per day, education, jo category, and activity the workplace

	Results	Comments
aire on iet age g year s for r prior to trols. pre- and men sted for all height dex were had a t so adjusted es	Premenopausal women: Adjusted for total energy, age at menarche, age at first birth: Magnesium intake: RR=.02 (.0005-.08) only significant finding Postmenopausal women: adjusted for total energy, age at menarche, and education: Total fat, SFA, MUFA, cholesterol, protein: Nonsignificant PUFA: RR=0.1 (0.03-0.7) Mono- and disaccharides: RR=0.02 (0.002-0.3) Cellulose: RR=0.04 (0.01-0.3) Beta-carotene, vitamin C, potassium, calcium, magnesium, and retinol equivalents all showed significant protective effects	Dietary fat not associated with breast cancer risk in either pre- or postmenopausal women. Results showing protective effects of some nutrients are difficult to interpret due to multiple comparisons and multiple models used in analysis, especially in light of the small number of study participants
aire on icator data on fat ings e and et ses onfirmed; for age, , ry of ease, f breast ity, age at at usal enopause, oral d other se	Total Fat (from seasonings) RR=1.5 (1.2-1.7) Butter RR=1.6 (1 2-2.1) Oil RR=1.2 (1.0-1 6) No effect shown with margarine consumption	Results not adjusted for total calories. Moderate association between intake of added fat in seasonings and breast cancer risk. Use of hospital controls could lead to selection of controls whose diseases are associated with high fat diets, although gastrointestinal diseases were excluded. Assessment of current diet rather than diet before onset of illness could bias results. Very limited dietary information available
dietary 99 food ssed in nterview; ogically ts adjusted es and for ted weight o r of meals on, job tivity in	RR's for quartiles of consumption: Total Calories: RR=1.0, 1.6, 1 6, 2.6 After adjustment for total calories: Cholesterol: RR=1.0, 0.9, 1.7, 1 7 Fiber from legumes: RR=1.0, 0.8, 0.5, 0.4 Protein: RR=1.0, 1.1, 1 7, 2.5 Carbohydrate: RR=1.0, 1.5, 1 4, 2 2 No effects found for total fat or saturated fats	Increased risk of colorectal cancer found for total calories, cholesterol, protein, and carbohydrates and protective effect found for fiber from legumes. No effect on colorectal cancer risk was found for increased consumption of total fats or saturated fats. This lack of association may be due to the population's consumption mainly of MUFAs rather than animal fats. Mean percentage of calories from fat was 37% for colon cancer cases, for rectal cancer cases and for controls

TABLE 1--cont

Study	Study Design	Subjects	Methods
Yeung, et al., 1991 (Ref. 138)	Correlational (Biochemical) Study: China and American; Colorectal Cancer	42 male and 50 female Chinese and 34 male and 33 female Chinese Americans; the two populations have fourfold difference in colorectal cancer risk	24-hour food, urine and stool samples analyzed; all subjects were randomly selected from volunteers
Geltner-Ailinger, et al., 1991 (Ref. 139)	Case-Control; Sweden; Colon Cancer	35 cases (16 men, 19 women); 46 population controls (26 men, 20 women)	Limited dietary intake information, diet assessed for preceding year; stool samples analyzed for bile acids and lipid concentrations; rectal biopsies collected for colonic epithelial cell proliferation rate analysis
Clausen, et al., 1991 (Ref. 140)	Clinical Study; Denmark; Colon Cancer	17 patients with colonic adenomas, 17 patients with colon cancer, and 16 healthy controls	Analyzed stool samples for short chain fatty acids; compared molar production velocities of short chain fatty acids from glucose, ispagula, wheat bran, and albumin in fecal incubations; no dietary assessment conducted

-continued

	Results	Comments
all	Chinese American diets were higher in fat and protein and lower in carbohydrates, stools contained more cholesterol and bile acids, and no difference in fatty acids, and urine contained more 3-methyl-hiatidine and malonaldehyde. Authors interpreted results to demonstrate that high fat, high protein, low carbohydrate diets are associated with increased colorectal cancer risk	Authors interpretation does not follow from study's findings due to methodological flaws: results are correlational only--no cases of colorectal cancer actually existed among participants; diet was assessed for 24 hours only; Chinese had higher participation rate than Americans; confounding by environmental and lifestyle factors were not controlled for in study
saed ool ile ted cell lysis	No differences found in the concentration of fecal bile acids or in colonic cell proliferation rates. No differences found in dietary intake of fat and fiber; female cases consumed slightly more calcium than controls (574 mg versus 370 mg)	Biological marker study; very small numbers of participants and very limited dietary assessment. No conclusions can be drawn from this study
for s; ion ain ase, and ry	Fecal concentrations of total short chain fatty acids and concentrations and ratios of the individual fatty acids did not differ among the two sets of patients and controls. Molar production velocities did not differ except for the ratio of butyrate production to total short chain fatty acid production from fiber was reduced in colon cancer and adenoma patients compared to controls	Authors speculate that the low ratios of colonic butyrate formation combined with low fiber diets may increase the risk of colonic neoplasia. Study provides very limited evidence that high fiber diets may reduce the risk of colon cancer, and no information is provided by study as to type of fiber responsible

Study	Study Design	Subjects	Methods
Yu, et al., 1991 (Ref. 92)	Correlational Study; China and U.S.; Colon, Rectal, Prostate and Breast Cancer	Chinese in Shanghai, Chinese Americans and Americans compared	Incidence rates of of the colon, rectu female breast, and compared using Con SEER data for Whit Americans, San Fra SEER data for Chin Americans, and dat the cancer registry Shanghai Tumor Ins for Shanghai Chine Incidence rates we standardized to th age distribution o world population. consumption data c using FAO data for from two Chinese publication source China

Bravo, et al., 1991 (Ref. 105)	Case-Control; Spain; Prostate Cancer; study conducted 1983 to 1987	90 cases; 180 controls from same hospital matched by age and date of hospital admission; controls were those with diseases other than urologic diseases or a primary tumor	Interview on types amounts of foods u consumed; obesity by body mass index cases were histolo confirmed; results adjusted for total

TABLE 1--continued

	Results	Comments
es of cancers rectum, , and prostate g Connecticut White n Francisco Chinese d data from gistry at the r Institute Chinese. es were to the 1970 ion of the ion. Food ata compared a for U.S. and ese ources for	Incidence rates for colon cancer among Americans were 4 times the Chinese rates, for rectal cancer among Americans were 2 times the Chinese rates, for prostate cancer among Americans were 26 times Chinese rates, and for postmenopausal breast cancer among Americans were 10 times the Chinese rates. Americans consumed 6 times more meat and eggs, 55 times more milk, slightly more fats and oils, and 3 times more fruit than Chinese	Study was correlational in design; there is no way to determine by this study if the persons who actually have these cancers also eat the putative diet. Study did not control for the very important known risk factors of these cancers such as lifestyle factors, family history, reproductive factors, and endocrine factors
c cancer es using 1985 data were dairy and ke obtained ance sheets 1981 FAO data	Highly significant correlations were found between dairy fat plus lard fat intake and mortality from all causes, total cancer, colon, and rectal cancer among both men and women and from lung cancer and prostate cancer for men only and breast cancer for women only. Correlations remained significant when adjusted for total caloric intake or for total caloric intake minus total fat intake	Study was correlational in design; thus, the diet of the persons with the diseases studied are not being analyzed directly. Study did not control for the very important known risk factors of these cancers such as lifestyle factors (e.g., smoking), family history, reproductive factors, and endocrine factors. Food balance sheet data from FAO are approximations of actual consumption and these data are not separated by age and sex
types and oods usually esity measured index; all istologically esults were not total calories	Risk of prostate cancer was increased by a diet rich in animal fats: RR=2.6 (1.3-5.0) Diets rich in vegetable fats, and vitamins A and C deficiencies were not associated with increased risk of prostatic cancer. Meat consumption was associated with increased risk: RR=2.3 (1.2-4.4) but different types of meat were not significantly associated with increased risk. No risk associated with obesity	Study demonstrates an increased risk of prostate cancer with diets rich in animal fats and with meat consumption. Results were not adjusted for total calories which severely limits the validity of the results. Hospital controls used, some with gastrointestinal diseases, and usual diet was assessed so that disease may have affected diet

TABLE 1

Study	Study Design	Subjects	Methods
West, et al., 1991 (Ref. 106)	Case-Control; Utah; Prostate Cancer; Study conducted 1984 to 1985	358 incident cases (179 aged 45 to 67 and 179 aged 68 to 74); 679 population-based controls (387 aged 45 to 67 and 292 aged 68 to 74), matched by county of residence	Interview using dieta questionnaire contain 183 foods; cases' diet assessed for 3-year pe prior to diagnosis or to symptoms; controls' assessed 3 year prior interview; all cases histologically confir interviewers not blin case or control statu respondent. Results adjusted for total calories. Interactio confounding between d variables and demograp and lifestyle factors assessed but none fou therefore, suthors re only crude relative r

ABLE 1--continued

	Results	Comments
dietary ntaining ' diet ear period is or prior trols' diet prior to ases onfirmed; blinded to status of ults were al raction and een dietary mographic ctors were e found; rs reported ive risks	No associations between dietary variables and prostate cancer found for men 45 to 67 years of age, either for all tumors combined or when subdivided by tumor aggressiveness. Males aged 68 to 74: For all tumors: Total Fat RR=1.7 (1.0-3.1) Protein RR=1.7 (1.0-2.9) For aggressive tumors: Total Calories RR=2.5 (1.0-6.5) Total Fat RR=2.9 (1.0-8.4) MUFA RR=3.6 (1.3-9.7) PUFA RR=2.7 (1.1-6.8) No dose-response seen; cholesterol not associated with prostate cancer risk for either age group	Study demonstrates that dietary fat is associated with prostate cancer risk among older men. Bias may have been introduced due to low participation rates: 77% of eligible cases and 77% of eligible controls participated. Interviewers were not blinded as to case or control status of respondent; this may have introduced bias if the interviewers were aware of the association between dietary factors and prostate cancer

Study	Objectives/ Tumor Types	Experimental Animals	Methods

Food and Drug Administration

21 CFR Part 101

[Docket No. 91N–0095]

RIN 0905–AB67

Food Labeling: Health Claims and Label Statements; Sodium and Hypertension

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is announcing its decision to authorize the use on the label or labeling of certain foods of health claims relating to an association between dietary sodium and high blood pressure. The agency has concluded that, based on the totality of the scientific evidence, there is significant scientific agreement among qualified experts that diets low in sodium may help lower blood pressure in many people. Therefore, FDA has concluded that claims on certain foods relating sodium reduction to reduced risk of high blood pressure are justified. This action is in response to provisions of the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) that bear on health claims, and is developed in accordance with the final rule on general requirements for health claims, which is published elsewhere in this issue of the Federal Register.

EFFECTIVE DATE: May 8, 1993.

FOR FURTHER INFORMATION CONTACT: Ellen M. Anderson, Center for Food Safety and Applied Nutrition (HFF–266), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202–205–5375.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of November 27, 1991 (56 FR 60825), FDA proposed to authorize the use on food labeling of health claims relating diets low in sodium to lower blood pressure in some people. The proposed rule was issued under provisions of the 1990 amendments (Pub. L. 101–535) that bear on health claims and in accordance with the proposed general requirements for health claims for food (56 FR 60537, November 27, 1991). As amended in 1990, the Federal Food, Drug, and Cosmetic Act (the act) provides that a food is misbranded if it bears a claim that characterizes the relationship of a nutrient to a disease or health-related condition unless the claim is made in accordance with section 403(r)(3) or (r)(5)(D) of the act (21 U.S.C. 343(r)(3) or (r)(5)(D)).

Section 3(b)(1)(A) of the 1990 amendments specifically requires that the agency determine whether claims respecting 10 nutrient/disease relationships meet the requirements of section 403(r)(3) or (r)(5)(D) of the act. The relationship between sodium and hypertension is one of the claims required to be evaluated. In the Federal Register of March 28, 1991 (56 FR 12932), FDA published a notice requesting scientific data and information on the 10 specific topic areas identified in the 1990 amendments. Relevant scientific studies and data received in response to this request were considered as part of the agency's review of the scientific literature on sodium and hypertension and were included in the proposed rule. Comments received in response to the notice and not specifically addressed in the proposed rule are summarized and addressed below.

• In addition to evaluating the scientific evidence, the proposed rule identified qualifying and disqualifying criteria for foods bearing health claims on sodium and hypertension. The proposed rule also specified mandatory and optional information for health claim statements and provided a sample claim. FDA requested written comments in response to its proposed rule and solicited comments on several issues in particular. The agency asked whether foods with minimal nutritional value should be allowed to bear health claims and whether a statement of the recommended range of sodium intake (500 to 2,400 milligrams (mg) per day) should be required or remain optional. The agency requested comments on requiring the use of the terms "sodium" rather than "sodium chloride" and "high blood pressure" rather than "hypertension," and on allowing the terms "salt" in addition to "sodium" and "hypertension" in addition to "high blood pressure." The agency also requested comments on whether a statement indicating that identified hypertensives should consult their physicians should be allowed or required, on the safety of the recommendations to reduce sodium and salt intake, and on the proposed "Consumer Summary on Sodium and High Blood Pressure."

On January 30 and 31, 1992, FDA held public hearings on all aspects of the proposed rules published in response to the 1990 amendments, including health claims for sodium and high blood pressure (57 FR 239).

In response to its proposed health claim regulation on sodium and hypertension, the agency received approximately 100 comments from consumers, consumer advocacy groups, State health departments, organizations of health professionals, the food industry, and Government agencies. A number of comments were received that were more appropriately addressed in other documents, and these comments were forwarded to the appropriate docket for response.

II. General Comments

1. One comment noted that it is difficult to find a variety of foods that meet recommended dietary sodium levels and expressed the hope that this regulation would encourage industry to provide more low sodium foods.

FDA strongly encourages innovation in providing consumers with a wider variety of choices. FDA's labeling and education initiatives in the early eighties resulted in a 60 percent increase in sodium content labeling from 1978 to 1988 (Ref. 46) and the introduction of additional low sodium products (Ref. 56). The current initiatives include not only sodium/hypertension health claims, but also mandatory sodium labeling, a daily value (DV) for sodium, sodium disqualifying levels for health claims, and sodium disclosure levels for nutrient content claims. FDA anticipates that these regulations will motivate manufacturers to develop and market a broader range of lower salt products for the American consumer.

2. Another comment argued that consumers will wrongly believe that consumption of foods with too much sodium to qualify for a sodium/hypertension health claim will necessarily lead to exceeding current dietary guidelines.

FDA disagrees. Rather, the agency believes that health claims will encourage the availability and consumption of foods that will help consumers meet dietary guidelines. Furthermore, auxiliary educational programs, consistent with the dietary guidelines philosophy, can help consumers understand that, by consuming a variety of foods, some higher in sodium and some lower in sodium, they can meet total dietary intake goals.

3. One comment opposed sodium restrictions on foods, arguing that restrictions would be likely to hinder the development of low fat foods and that reducing fat in the diet is more important than reducing sodium. The comment submitted supporting data from surveys in which nutritionists and

physicians rated their most important health concerns (Refs. 137 and 142). Although reduction in sodium intake was ranked as a "high priority" for good health (Ref. 142) and a "moderate priority" for improved heart health (Ref. 137), the comment noted that the survey results indicate that reducing fat was considered a higher priority than reducing sodium.

It was not clear whether the comment objected to sodium/hypertension health claims, to disqualifying levels for sodium on other health claims, or to both. In the 1990 amendments, Congress specifically identified sodium and hypertension as one of ten topics to be evaluated for health claims and did not limit claims to the highest priority health issues. FDA evaluated the totality of the scientific information and the extent of the scientific agreement among qualified experts and concluded that claims for sodium and hypertension should be allowed. In addition, the provisions of the 1990 amendments state that health claims may not be made on a food that contains a nutrient that increases the risk of a disease or health-related condition. Sodium was one of four nutrients identified by the agency as increasing the risk of a disease or health-related condition.

FDA disagrees that these survey results are relevant to its duty under the 1990 amendments with regard to health claims for sodium and hypertension. FDA need only establish that a relationship between sodium and hypertension is supported by the totality of the scientific evidence and by significant scientific agreement among experts qualified by experience and training to evaluate such evidence. A poll of scientists ranking sodium/hypertension concerns relative to fat/heart disease concerns does not contribute to this process.

FDA recognizes the importance of encouraging the development and use of more low fat foods. The agency has authorized two health claims that may appear only on foods low in fat (final rules on lipids and cardiovascular disease and on lipids and cancer health claims, published elsewhere in this issue of the Federal Register). Sodium is a disqualifying nutrient for these and other health claims, because diets high in sodium increase blood pressure in many people and, therefore, increase the risk of high blood pressure and associated risks of heart disease and stroke. (See the final rule on general requirements for health claims, published elsewhere in this Federal Register).

4. Several comments asserted that the agency adequately considered safety concerns regarding reductions in sodium intake in the proposed regulation. The Life Sciences Research Office (LSRO) of the Federation of American Societies for Experimental Biology (FASEB) prepared a final independent evaluation of the scientific evidence on sodium and hypertension (Ref. 138) and submitted this as a comment. An earlier draft of the report (Ref. 108) was discussed in the proposed rule (56 FR 60825 at 60829). The FASEB report (Ref. 138) concluded that severe sodium chloride restriction (less than 20 milliquivalents (meq) or 460 mg sodium per day) may have adverse consequences, but that, in the absence of obvious salt-losing disorders, there is no evidence that avoiding high sodium chloride intakes would be deleterious to health. Other comments, including a review article (Ref. 144), disagreed with FDA's assessment, arguing that there is inadequate scientific evidence that curtailing sodium will safely reduce the risk of hypertension; that there is a growing body of scientific evidence that reducing sodium may put some healthy people at risk, that no populations with free access to salt choose such low levels and the risks of these levels have not been considered; that severe restriction in animals results in some risks; that in the older literature, extremely low sodium intake in humans resulted in some symptomatic distresses; and that FDA has no studies that demonstrate safety and efficacy of universal sodium restriction, especially in normotensives. The comments submitted no data demonstrating that daily dietary intakes of 2,400 mg sodium are unsafe.

The agency has considered and addressed the safety concerns and believes that the recommended goal of 2,400 mg per day is safe. The National Academy of Sciences, which recommended the 2,400 mg daily goal, is considering dropping the current target goal to 1,800 mg sodium per day (Ref. 62). Furthermore, the 1989 Recommended Dietary Allowances (Ref. 63) identify 500 mg sodium as a safe minimum daily intake for adults, and 2,400 mg is well above this safe minimum intake level. Other authoritative documents also agree that a moderate sodium intake is safe (Refs. 38, 43, and 62). Numerous experiments with low sodium diets have been conducted with no serious consequences. Finally, dietary guidelines since the early eighties (Refs. 9, 22, and 85) have recommended moderation in sodium intake with no ill effects. Given these conclusions, the lack of data demonstrating safety concerns with daily consumptions of 2,400 mg sodium, and the extreme difficulty in achieving an intake of sodium at or below the 500 mg per day minimum safe level in the U.S. diet, FDA concludes that there are no safety risks associated with use of the sodium/hypertension health claim.

5. A few comments from health professionals supported FDA's description of the special considerations and risks involving sodium losses during sustained exercise or training in hot temperatures. One comment specifically supported responding to these risks with education efforts as proposed by the agency.

FDA acknowledges these comments.

6. Some comments supported FDA's conclusion in the proposed rule that the study results (Refs. 33 and 72) that suggest some individuals may respond to sodium reduction with blood pressure increases rather than decreases may be due to random variations and require additional research to determine if the results of these few studies are significant and reproducible. Other comments disagreed. One comment stated that many people believe that the results of the INTERSALT study (Ref. 37) confirm this heterogeneous blood pressure response.

FDA acknowledges that there is wide variability in blood pressure response to changes in sodium intake, but disagrees that recommended sodium intake goals pose safety risks. The INTERSALT (Ref. 37) and other study results (Refs. 41, 44, 45, 76, 80, 94, 97, 100, 106, 107, 109, 121, 122, and 123), in spite of large background fluctuations and a dilution effect of including nonresponsive individuals, clearly show that reducing sodium intake has a measurable and beneficial effect on reducing average blood pressure. The agency encourages additional studies under controlled conditions; however, FDA disagrees that this normal variability, which commonly occurs with physiological measurements, calls into question the safety of current intake recommendations of 2,400 mg per day.

7. A few comments supported FDA's conclusion in the proposed rule that the possible adverse changes in plasma lipids in response to sodium restriction (Refs. 2, 40, 49, and 89) do not pose safety concerns for the general public consuming recommended intakes of sodium. One comment indicated that the sodium intakes in these studies were very low and that the observed effects could have been due to dehydration. Other comments disagreed. One comment, accompanied by three studies, accused FDA of failure to give

the plasma lipid studies proper consideration.

In preparing its proposal, FDA reviewed the plasma lipid studies submitted. Sodium intake levels in these studies were very low (460 and 780 mg daily) relative to current U.S. intakes (approximately 3,000 to 6,000 mg daily) and dietary guidelines (2,400 mg daily). Also, the intervention periods were very short (one week or less). The agency encourages additional research, but disagrees that a few studies involving sodium intakes of 460 to 780 mg daily are relevant or raise safety concerns for the general public consuming well in excess of this amount or for public health agency recommendations encouraging moderate sodium intakes of 2,400 mg per day.

8. One comment included recent study data (Ref. 91), which the comment believed linked reduced sodium intake to high plasma renin levels and risk of myocardial infarction.

FDA reviewed the study data submitted and located a review article associated with the original study (Ref. 96). The incidence of myocardial infarction was low (27 instances in 1,717 subjects over 8.3 years) in a narrow and limited population group (predominantly nonwhite, hypertensive males with 20 percent excluded for renin levels outside the limits established for the study). Furthermore, sodium intakes per se were not evaluated in relationship to potential risk. It is unclear whether there is a causal relationship or whether renin levels simply serve as a marker for high risk. It is clearly premature to extrapolate the results of one study with a variety of limitations to the effects that a modest reduction in dietary sodium may have on the general population.

9. One comment mentioned that sodium restriction might precipitate sodium depletion in people with "wasting" nephropathy or chronic renal failure, but that it might also ameliorate their hypertension. The comment noted further that, at this time, there is not enough information to know what might occur and that patients with these diseases need specific advice from their physicians.

FDA agrees that there is not enough information to know if sodium restriction to 2,400 mg would pose any concern or be of any benefit with regard to "wasting" nephropathy or chronic renal failure. These are serious diseases and persons with these conditions should be under a physician's supervision and monitoring. Should these persons need to be concerned about their sodium intake, mandatory nutrition labeling of sodium content on all foods can help them meet specific dietary goals set by their physicians and health care consultants.

10. A couple of comments expressed concern that, in consuming low sodium foods, individuals might be missing important nutrients.

FDA disagrees. Many nutrient-rich foods are relatively low in sodium and will qualify for sodium/hypertension health claims (e.g., fruits, vegetables, and some dairy products). Additionally, substitute foods formulated to be low in sodium must be nutritionally equivalent to the foods that they are intended to replace (21 CFR 101.3(e)). Failure to maintain nutritional equivalency results in identification of the substitute food as an "imitation" product. With the mandatory labeling of a core set of nutrients, including sodium, for foods generally (see the final rule on mandatory nutrition labeling published elsewhere in this issue of the Federal Register), people consuming low sodium foods as part of a total diet can select a variety of foods and meet nutrient needs.

11. One comment stated that FDA has determined that current U.S. intakes of sodium are not safe. The comment argued, therefore, that current levels are not generally recognized as safe (GRAS), that the food industry should bear the burden of proof that current levels are safe, and that, in the absence of such proof, FDA is obligated to require that salt levels be reduced and the food industry is obligated to lower the levels of salt currently being added to foods.

FDA disagrees. Salt has traditionally and historically been regarded as a GRAS substance (21 CFR 182.1), and the GRAS safety review in 1982 (47 FR 26590, June 18, 1982) deferred regulatory action until the impact of the sodium labeling initiatives (47 FR 26580, June 18, 1982; 49 FR 15510, April 18, 1984) could be assessed. The agency is not aware of any new data that would raise significant additional safety concerns. There is thus no basis for reopening the question of salt's GRAS status at this time.

III. Statement of the Relationship of Sodium and Hypertension

In the proposed rule (56 FR 60825), FDA tentatively concluded that, based on the totality of the scientific evidence, there is significant scientific agreement among qualified experts that there is a relationship between sodium intake and high blood pressure. Some comments agreed with this conclusion, often providing no evidence. A few comments disagreed and provided specific reasons for their objections.

12. Several comments supported FDA's conclusion that there is sufficient evidence of and significant agreement about a relationship between sodium and hypertension. The FASEB report (Ref. 138) concluded that "both observational data and intervention trials document a small, but consistent effect of dietary sodium chloride on blood pressure." The report further noted that the association between sodium intake and blood pressure may be more meaningfully extrapolated to a population than applied to an individual, that additional studies are necessary to assess the dose-response relationship, and that human data provide no evidence that blood pressure at one age is related to salt intake at an earlier age. A submitted study by Espinel (Ref. 143) identified specific patients and levels of salt intake that triggered hypertension. The results were repeated between 2 months and 1 1/2 years later and remained stable and reproducible.

A few comments and a review article (Ref. 144) disagreed and noted that the scientific data on sodium and hypertension are variable, complex, inconsistent, and more complicated than previously accepted. These comments argued that the epidemiological (i.e., observational) evidence is weak and that information from a natural setting where individuals select their own diets provides no information on how alterations would affect blood pressure. They also argued that modification studies have been short-term, that there are few long-term maintenance studies and data, and that the data are insufficient to support significant long-term effects, including long-term blood pressure changes and reduced rates of stroke and cardiovascular disease. These comments noted that, in contrast, clinical trials of lifesaving drugs often last several years. They suggested that FDA erroneously cited the INTERSALT study to establish that a lifetime lowering of sodium chloride would lower risk of hypertension, and that FDA should avoid giving prescriptive recommendations on weak observational data.

These comments argued further that there is significant controversy regarding the relationship between sodium and hypertension and, therefore, insufficient scientific agreement to support a health claim. The comments noted that the FASEB Report (Ref. 108) concluded that the within-population study data were inconclusive or showed low correlation, and that there was only sparse or inconclusive long-term information

about the relationship. They observed that no consensus was reached at the Workshop on Salt and Hypertension (Ref. 103), and noted that the Dietary Guidelines Advisory Committee (Ref. 135) reported that such a lack of consensus, especially relative to guidance for nonhypertensives, was apparent. (Other comments indicated that, even though consensus was not an aim of the workshop, a large degree of consensus was exhibited.) The comments observed that FDA acknowledged in its proposal the highly polarized views at the Hypertension Workshop (Ref. 103) and the controversy over the interpretation of the INTERSALT results (Ref. 37). The comments argued that the intense and continuing nature of the debate over the relationship between sodium and hypertension evidences lack of significant scientific agreement. The comments accused FDA of not attempting to understand the controversy and change its public health policies, but rather simply dismissing new studies and asserting that there is significant agreement among scientists.

FDA agrees with the FASEB report that there is a small but significant effect of sodium on blood pressure and with the Espinel study results demonstrating that sodium intake can trigger hypertension. This position is consistent with the tentative conclusions reached in the proposal. FDA noted in the proposed rule that the science is complicated by the multifactorial nature of the blood pressure response and that blood pressure varies for each individual and among different individuals. Nonetheless, in spite of large average fluctuations in confounding variables and the resultant impact on blood pressure response, there continues to be a small, significant, and independent impact of sodium on blood pressure, which is supported by the FASEB report (Ref. 138), the National Academy of Sciences' Report (Ref. 62), the Surgeon General's Report (Ref. 43), the INTERSALT study (Ref. 37), and other recent studies (Refs. 41, 44, 45, 55, 71, 76, 80, 90, 94, 97, 100, 106, 107, 109, 121, 122, and 123).

FDA recognizes that data from carefully controlled clinical trials are stronger than data from human observational studies. The methodologic problems in observational studies are more difficult to address adequately, and there are more individually negative observational studies than trials. Furthermore, pooling of studies is more difficult for observational studies, because of the need to control for confounding variables. Finally, most observational studies are cross-sectional, so they do not establish time-orders (i.e., cause precedes effect). However, despite these limitations, FDA contends that, in general, the human observational data support a relationship between sodium and hypertension. The recent, multinational INTERSALT study (Ref. 37) used carefully standardized methodologies and comprehensive data analysis. The study reported a significant relationship between sodium intake and systolic blood pressure (SBP) for the pooled within-center data and for changes in blood pressure with age for the across-center data. This conclusion is likewise supported by other authoritative reports (Refs. 43 and 62) and is consistent with and strengthened by the experimental evidence provided by randomized clinical trials.

FDA acknowledges that long-term, prospective study data are limited and sometimes inconclusive. However, obtaining definitive, long-term human data on the development of hypertension may be difficult due to a wide variety of factors: (1) the long time necessary for the development of the disease, (2) the large sample and control populations needed for statistical significance, (3) the small absolute magnitude of the effect of sodium on blood pressure, (4) the wide variations in salt content in foods and food products, (5) the large day-to-day and year-to-year variability in dietary sodium intake, (6) the large fluctuations in blood pressure response in the individual, (7) the multifactorial response of blood pressure to a wide variety of nutritional and environmental factors, and (8) the ethical considerations of encouraging or maintaining long-term, high-sodium diets in a control population. The feasibility of obtaining definitive study data was discussed in greater detail in the proposed rule on general requirements for health claims (56 FR 60537 at 60548 through 60549). Nonetheless, although three long-term intervention studies were inconclusive (Refs. 42, 70, and 124), the abstract (Ref. 123) and the recently reported final study results (Ref. 145) of the 18-month Trials of Hypertension Prevention (TOHP) Collaborative Research Group, which were published subsequent to the proposed regulation, reported conclusively that a reduction in sodium intake reduced blood pressure in the sodium intervention group and also showed a trend towards a reduced incidence of hypertension. The 18-month followup of the Koopman study (Ref. 76) also documented reduced blood pressure in response to reduced sodium intake. The results of these clinical trials are thus consistent with and strengthen the INTERSALT results (Ref. 37), which are cross-sectional. Additionally, the INTERSALT study provides useful information for making limited inferences on long-term effects of sodium reductions on blood pressure. The INTERSALT study reported a statistically significant relationship between sodium intake and the slope of SBP and diastolic blood pressure (DBP) with age; i.e., the difference in blood pressure of older individuals in a population relative to younger individuals in the same population is greater in populations with high sodium intake than in populations with low sodium intake. The lack of definitive long-term studies is, therefore, not sufficiently problematic to disallow sodium/hypertension health claims, given the strength of the short-term clinical data relating sodium intake and blood pressure, the difficulties associated with obtaining long-term sodium/hypertension data, and the long history of support by authoritative bodies for public health policies encouraging all people to reduce their sodium intake.

Finally, FDA recognizes that, as is typical in science, there is a wide range of opinion regarding the relationship between sodium and hypertension, and consensus is rarely reached. A requirement for "significant scientific agreement" has not been interpreted by FDA to mean a requirement for consensus. (See final rule on general requirements for health claims, published elsewhere in this issue of the **Federal Register**.) FDA believes that there is sufficient scientific evidence to provide strong support for a relationship between dietary sodium intake and high blood pressure, and that there is significant scientific agreement that the evidence supports the relationship. In the proposed rule, FDA summarized Government and authoritative reports that concluded that the evidence was sufficiently strong to support a relationship between salt or sodium and high blood pressure, and many of these reports recommended that sodium intake be decreased (Refs. 38, 43, 62, 63, and 85). The interim and final FASEB reports (Refs. 108 and 138) concluded that the totality of the data supports a relationship between dietary sodium chloride and blood pressure. The INTERSALT study (Ref. 37) reported evidence of a relationship between sodium and high blood pressure. Most authors supported the INTERSALT findings and favored sodium restriction

(Refs. 50, 52, 60, 69, 75, 111, and 114), whereas only a few authors considered the effect to be too small and opposed sodium restriction (Refs. 90 and 120). The other scientific studies evaluated in the proposed sodium/hypertension health claim regulation generally supported a relationship between sodium and high blood pressure, although a few were inconclusive or not supportive. Finally, most of the reports at the Hypertension Workshop (Ref. 103) supported reductions in dietary sodium intake (Refs. 94, 95, 97, 98, 102, 104, 105, and 113), while only a few were in opposition (Refs. 110 and 112). Vigorous, spirited debate is necessary to the scientific process and should be encouraged. However, despite the existence of differences of opinion, FDA concludes that, based on the totality of the scientific evidence, there is significant scientific agreement among qualified experts that diets high in sodium are associated with high blood pressure.

13. One comment questioned FDA's evaluation of the INTERSALT data (Ref. 37), indicating it was possibly serious abuse of the scientific data, including a possibly intentionally misleading interpretation. The comment stated that the INTERSALT authors, in their abstract, concluded both that there was no relationship between sodium intake in a society and the prevalence of hypertension within that society, and that there was a positive association between the level of sodium in a society's diet and the rate of rise in blood pressure with age. The comment argued that, if both statements are correct, then the societies with higher sodium intakes must have had lower blood pressures earlier in life, could not have had more hypertension even after 40 years, and must have had lower blood pressures from 20 to 60 years of age.

The FASEB report (Ref. 138) summarized the results of the INTERSALT study, noting that, after adjustments for age and gender, sodium was significantly correlated with SBP in 39 of the 52 centers and with DBP in 33 of the 52 centers, and that there was a significant linear relationship between average sodium excretion and the slope of SBP with age for all 52 centers, which remained significant when four populations with low salt intakes were excluded.

FDA disagrees with the comment criticizing FDA's evaluation of the INTERSALT study. The conclusions of both the FASEB report (Ref. 138) and the authors of the INTERSALT study are consistent with FDA's interpretation and not with those of the objecting comment. In the discussion, the INTERSALT study authors noted that some of the results across the centers were no longer statistically significant when the results from four centers with low sodium excretion were excluded. They attributed this to diminished statistical power due to an upper limit of sodium intake that was lower than anticipated, which resulted in a range of intakes too narrow to provide adequate detection sensitivity. They also noted that multiple confounding factors, such as climate, physical activity, and acculturation, would affect results across several centers but would be less likely to confound results within centers. The authors concluded by emphasizing that the data across the centers showed a significant positive association between sodium intake and the slope of increasing blood pressure with age for all 52 centers, which remained significant when the 4 populations with low salt intakes were excluded. These results are consistent with the findings within the centers. FDA believes that it has presented an accurate summary of the INTERSALT results that neither intentionally nor unintentionally misrepresented the authors' findings. FDA also believes that the INTERSALT study provides a useful piece of evidence for supporting the sodium/hypertension relationship that is consistent with and strengthens conclusions in recent consensus and authoritative reports (Refs. 43, 85, 62, and 63).

14. A couple of comments contended that, because there is controversy surrounding the interpretation of the INTERSALT data, FDA is legally and scientifically obligated to independently review the primary data tapes and to make the original data publicly available.

FDA disagrees and notes that it is not reviewing primary data for any of the studies it is evaluating. Rather, the agency reviewed and summarized publicly available scientific reports and publications of results from the INTERSALT study, including both significant and inconclusive findings (56 FR 60825 at 60829 through 60830). FDA considered all these results in determining whether the totality of scientific evidence supported a relationship between sodium and hypertension. This satisfied the agency's legal obligation to evaluate the publicly available scientific evidence and determine whether, based on the totality of that evidence, there is significant scientific agreement among qualified experts that a health claim for sodium and hypertension is supported. Since the primary data tapes from the INTERSALT study are not publicly available, the agency did not review that evidence. The agency does not have the authority to compel the release of these data.

15. One comment objected to the findings of the TOHP Collaborative Research Group study (Ref. 145) (see section VIII.A.5. of this document), which reported significant average decreases in blood pressure (1.7 millimeters of mercury (mm Hg) SBP; 0.9 mm Hg DBP) with average daily reductions in sodium of 55.19 millimoles (mmol) or 1,270 mg in 2,182 normotensives over an 18-month period. The comment suggested that the study methodology was flawed because the sodium reduction intervention group was compared with unmasked nonintervention controls, because the sodium reduction group was compared with a subset (417 subjects) of the "usual care" control group (589 subjects), and because the authors failed to explain the drop in blood pressure of the control group, which was two-thirds of the decrease noted in the sodium reduction intervention group.

FDA disagrees. As the authors noted, achieving sodium reduction via dietary changes requires active and conscious cooperation of the intervention participants in changing shopping, cooking, and food selection behaviors. Therefore, it would not have been feasible to blind the study participants to the dietary changes necessary to reduce sodium intake. In addition, it would have been impractical to follow free-living participants who are blinded to sodium intake for an 18-month period. Most importantly, the study included blinding at the critical point, blood pressure measurement, that is, trained, certified observers, who were blinded to the dietary sodium status of the participants, took the blood pressure measurements of participants at 3, 6 12, and 18 months. In addition, the success of the dietary sodium intervention and possible confounding factors were independently monitored at 6, 12, and 18 months by collecting 24-hour urine samples for sodium analysis, and weighing participants. With regard to the number included in the control group systematically and randomly assigned, the total cumulative number of controls was 589 generated as a result of conducting three separate intervention studies. Furthermore, as noted in Figure 1 in the article, the number of control subjects available for respective comparisons varied due to stratification by clinic and body mass index, and as noted on page 1,214 of the article, in clinics where both weight reduction and sodium reduction were

studied, a higher number of subjects were assigned to the control group to provide sufficient high-weight controls for comparison with the weight reduction intervention. Thus, it is inaccurate to conclude that 172 controls were excluded, since none of the three intervention groups had a control group of all 589 controls. Finally, although both the sodium reduction intervention and the control group experienced decreases in blood pressure, the sodium reduction intervention group's decrease in blood pressure relative to the control group was statistically significant. Furthermore, although the control group was not specifically instructed in ways of reducing sodium intake, the independent measures indicated that, at 18 months, the sodium intake of the control group had decreases by 11.33 mmol (260 mg) sodium as compared with 55.19 mmol (1,270 mg) in the sodium reduction intervention group. This reduction in sodium could account for some of the decrease in blood pressure observed in the control group. In conclusion, the epidemiologic study design was rigorous. The study results provide important insight into the relationship between sodium intake and blood pressure in a normotensive population and also into the long-term impact of sodium reduction on both blood pressure and the development of hypertension over time.

16. One comment objected to FDA's definition of normotension, SBP below 140 mm Hg and DBP below 90 mm Hg, arguing that this implies that blood pressures below 90 mm Hg are without risk. The comment noted that those with DBP between 80 and 90 mm Hg account for one third of cardiovascular disease response. The comment suggested that labels state that blood pressure should ideally be no more than 120 mm Hg SBP and 80 mm Hg DBP.

FDA disagrees. In the proposed rule, the agency acknowledged that the definitions of hypertension and normotension are based on correlations with risk of heart disease and stroke, differ by organization and purpose (Refs. 4, 17, 27, and 38), and are currently under review by the Joint National Committee of the National Heart, Lung, and Blood Institute at the National Institutes of Health. The definitions were changed in 1984 (Ref. 23) based on Public Health Service recognition that there is substantial risk associated with blood pressure levels between 140 and 160 mm Hg SBP and between 90 and 95 mm Hg DBP. These definitions will continue to be monitored; however, it would be very confusing to consumers if various government agencies used different definitions of hypertension and normotension. Consequently, FDA adopted the current Public Health Service definitions.

IV. Statement of the Significance of the Sodium and Hypertension Relationship

17. A few comments argued that the general population should be considered to be the general normotensive population, and that studies on hypertensives would, therefore, not be relevant. The comments suggested also that the data on normotensives are sparse, heterogeneous, and short-term, and that there is no clear, persuasive scientific evidence that healthy people in the general population would benefit from sodium reduction or that sodium increases the risk of hypertension in the general population. The comments concluded that the data do not support a recommendation that 200 million normotensives should reduce their daily sodium intake by half.

FDA disagrees with this assessment. Under new § 101.14(b)(1), set out in the final rule on general requirements for health claims, published elsewhere in this issue of the **Federal Register**, to qualify for a health claim a "substance must be associated with a disease or health-related condition for which the general U.S. population, or an identified U.S. population subgroup (e.g., the elderly) is at risk." The general population is at risk for hypertension, and sodium consumption is associated with hypertension. One third of the adult, U.S. population is hypertensive (Ref. 85) and many of these are expected to benefit from sodium reduction. Furthermore, many normotensives are likely to benefit as well, because even in the range of normal blood pressures, mortality risk from stroke and heart disease decreases as blood pressures drop (Refs. 68, 69, and 114).

18. One comment opposed the sodium/hypertension claim, arguing that high blood pressure affects a large segment of the population, but that only a minority are salt sensitive and that this fact should be stated if claims are permitted. Other comments argued that there is wide variation among individuals in salt sensitivity, that many patients are not responsive to sodium, and that health claims should not be allowed because only 12.5 percent of the population, the salt-sensitive hypertensives, would benefit. Another comment said that sodium restriction would benefit a large portion of the population, 20 to 40 percent, and one comment argued that FDA should change its statement to indicate that "many" people, rather than "some," would be likely to benefit. One submitted study (Ref. 143) reported that 13 of 30 well-established hypertensive patients (DBP greater than 90 mm Hg) could control their blood pressure (DBP below 90 mm Hg) on a low salt diet (2 g salt or 780 mg sodium per day). The blood pressures of the remaining patients were reduced as well (SBP: from 173.3 to 164.1 mm Hg; DBP: 102.9 to 98.2 mm Hg) but not enough to return to normotensive levels. The FASEB report (Ref. 138) noted that, "[al]though it is clear that there is a marked heterogeneity of blood pressure responses to alterations of dietary NaCl in both the experimental animal and in man, currently, there is not a uniform definition of salt sensitivity of blood pressure." The report concluded that, "until more information is available, caution is recommended before arbitrarily classifying individuals as NaCl sensitive or NaCl resistant."

FDA recognized in its proposed rule that not all persons may be sensitive to salt. However, all salt-sensitive individuals, those with high blood pressures as well as those with normal blood pressures, are likely to benefit from sodium reductions, since mortality risk from stroke and heart disease drops as blood pressures decrease. Even within the range of normal blood pressures, the lower the blood pressure, the lower the risk (Refs. 68, 69, and 114).

Recognizing that the response varies widely between individuals and that not all people are likely to benefit, FDA originally proposed that health claims indicate that a low sodium diet is associated with lower blood pressure in "some people" (proposed § 101.74(c)(2)). Upon reconsideration, the agency agrees with the comment that suggests that more than "some" individuals are likely to profit from reducing sodium intake. The word "some" may erroneously lead consumers to believe that only a small percentage of the population will benefit and may discourage many people from following this dietary goal. Some scientists have estimated that 30 to 60 percent of hypertensives and 15 to 45 percent of normotensives are salt sensitive (Ref. 116) and would thus benefit from sodium reduction. Taken together, this represents a significant segment of the U.S. adult population. FDA is persuaded that these numbers may not be accurately conveyed by noting that "some" people may benefit from sodium reduction. The agency has therefore dropped the use of the qualifier from the regulation. The agency believes that requiring the use of "may" or "might" (new

§ 101.74(c)(2)(i)(A)) to describe the relationship between sodium intake and blood pressure conveys the meaning that not all individuals respond to sodium restriction with lower blood pressure levels. The statement of the significance of sodium in relation to high blood pressure now includes the following sentences at new § 101.74(b)(1): "The scientific evidence indicates that reducing sodium intake lowers blood pressure and associated risks in many but not all hypertensive individuals. There is also evidence that reducing sodium intake lowers blood pressure and associated risks in many but not all normotensive individuals as well." Consistent with other health claim regulations, the final rule specifically permits the inclusion in a claim of information on the number of people in the United States who have high blood pressure.

19. A few comments contended that moderate reductions of less than 100 mmol sodium (2,300 mg) sodium would have limited impact. A couple of these comments noted that the relationship between sodium and hypertension in the INTERSALT study was significant when all 52 centers were included, but not when only 48 centers were considered. The comment considered the sodium intake range in the 48 centers to be comparable to sodium intakes of Western diets, and argued that since the results were not significant in this group, sodium intake changes in this range would not have any significant effect. A few comments also stated that no populations with free access to salt voluntarily choose such low levels. A few comments suggested that reducing sodium intake significantly was not feasible in Western populations. Others disagreed. One comment noted that the public health benefit could be substantial because food habits are linked to preventable diseases. Another comment extrapolated its clinical findings to the total population and estimated that FDA's reference value of 2,400 mg for sodium could result in cost savings of $2.1 billion per year by reducing costs of hypertension medications for patients who can control their blood pressure by diet alone. They further noted that additional cost savings could be expected through reductions in medication dosages, medication side effects, hospitalization, and costs associated with stroke, heart disease, and kidney disease.

FDA agrees with the comments that suggest sodium restriction will have a significant impact. Average estimates of the effect of a reduction in sodium intake of 100 mmol (2,300 mg) per day on SBP range from 2.2 mm Hg (Ref. 37) to 5 to 10 mm Hg (Ref. 106). Since these are population averages and therefore composite figures, the individual impact for many people will be greater than average. Furthermore, estimates suggest that over a 30-year age span (i.e., 25 to 55 years of age), this reduction of 100 mmol per day corresponds to a reduction in mortality rate of 16 percent for heart disease and 23 percent for stroke (Refs. 69 and 114). Other estimates indicate that a 1,150 mg daily change in sodium intake over a 10-year age span (i.e., 50 to 59 years of age) would result in a 26 percent reduction in stroke and a 15 percent reduction in heart disease in Western populations (Ref. 107).

FDA agrees that there is significant potential benefit if moderate sodium intakes in the U.S. population can be achieved and maintained. This is a feasible goal, because it has been estimated that 90 percent of dietary sodium is from salt added during food processing and manufacturing (75 percent) and during food preparation and consumption (15 percent). Thus, only 10 percent of sodium is naturally occurring in food. The agency notes that populations that voluntarily choose to consume high levels of sodium also have high prevalence of hypertension and greater increases of blood pressure with age. FDA continues to believe that encouraging reductions in sodium intake will benefit millions of Americans.

20. One comment objected to health claims listing ways of reducing sodium without noting that the majority (75 percent) is added to foods in processing, and the most effective strategy to reduce sodium intake is to avoid high-sodium, processed foods.

In the proposed rule, FDA included ways to reduce sodium intake as part of the significance statement, § 101.74(b): "In order to reduce sodium intake, individuals can choose foods with less sodium and salt, reduce the amount of sodium and salt used in food preparation and cooking, and reduce the amount of salt added at the table." This information has been deleted from the final rule in order to make it consistent with the final rules authorizing other health claims. However, the same information is included in "Nutrition and Your Health: Dietary Guidelines for Americans" (Ref. 85). This information is truthful and correct, and manufacturers may provide this or similar information as long as it is presented in a truthful and nonmisleading manner. Furthermore, FDA agrees that most sodium is added in manufacturing and processing; however, the agency has restricted sodium/hypertension health claims to foods naturally low or processed to be low in sodium and salt.

V. Requirements

FDA received many comments about its proposed disqualifying criteria for sodium and hypertension health claims. Some of these comments supported and some opposed the concept of disqualifying criteria, the selected nutrients, the proposed levels, and the per 100-gram (g) criterion.

FDA has made several changes that affect disqualifying criteria, and these changes are discussed more fully in the final rules on general requirements for nutrient content claims, general requirements for health claims, Reference Daily Intakes (RDI's) and Daily Reference Values (DRV's), and serving sizes, which are published elsewhere in this issue of the **Federal Register**. FDA has retained sodium, fat, saturated fat, and cholesterol as disqualifying and disclosure nutrients, but the levels have changed due to changes in serving sizes, in the caloric basis for DV's (from 2,360 to 2,000 kilocalories), in the cutoff percentage for disqualifying nutrients (from 15 percent to 20 percent of the DV), and in the density criteria for disqualifying nutrients (from per 100 g to per 50 g for foods with reference amounts of 30 g or less or two tablespoons or less). As discussed below, these changes have resulted in additional foods qualifying for sodium/hypertension health claims.

The requirement that foods meet the "low sodium" content claim requirements was inadvertently removed from the proposed regulation and a notice to that effect appeared in Corrections to Proposed Regulations (57 FR 8180, March 6, 1992). It has been added to the final rule as new § 101.74(c)(2)(ii).

21. Several comments supported FDA's requirement that, in order to qualify for sodium/hypertension health claims, foods must meet the qualifying criterion for "low sodium" foods. Comments also favored allowing health claims only on foods that make a nutritional contribution to the diet. One comment supported requiring foods to meet the "very low sodium" (35 mg sodium) rather than the "low sodium" (140 mg sodium) criterion before being allowed to bear sodium/hypertension health claims. It argued that this would be consistent with prior FDA practices and with scientific evidence that only primitive societies with sodium intake levels at or below this level can avoid developing hypertension. The comment further argued that the only appropriate

target population for sodium/hypertension health claims is individuals on medically restricted diets, that the medical evidence suggests that only salt-sensitive hypertensives would benefit from sodium restriction, and that the INTERSALT (Ref. 37) data showed no effect for diets between 2,300 mg and 4,600 mg sodium per day. The comment concluded that 15 to 26 servings of "very low sodium" foods would provide a daily intake of only 525 to 910 mg sodium, and that this intake level corresponds to the intakes of low sodium populations that had little or no hypertension, and would, therefore, be low enough to have an impact on blood pressure.

FDA disagrees with these comments and contends that restricting sodium/hypertension health claims to "low sodium" foods is consistent with prior agency initiatives that emphasized developing and maintaining policies appropriate for the general public (47 FR 26580, June 18, 1982; and 49 FR 15510, April 18, 1984). The agency does not agree that the only appropriate target population is individuals on medically restricted diets. Furthermore, as discussed in comments 17 and 18 of this document, FDA disagrees that only hypertensives would benefit from reduced sodium intakes. Estimates suggest that 15 to 45 percent of normotensives are likely to benefit from salt (sodium) reduction (Ref. 116). Even within "normal ranges," lower blood pressures are generally associated with reduced mortality risk for the normotensive population as well as for the hypertensive population (Refs. 68, 69, and 114). In addition, 15 to 26 servings of "low sodium" foods would provide from 2,100 to 3,640 mg sodium per day. This is consistent with the DV for sodium of 2,400 mg, published elsewhere in this issue of the Federal Register. This is also consistent with FDA's policy that health claims are intended for the general population. Conversely, requiring foods bearing health claims to meet requirements for "very low sodium" could result in a sodium intake from 525 to 910 mg sodium per day, a value more appropriate for therapeutic diets than for diets for the general population. FDA is encouraging the entire population to moderate sodium intake, but the goal for the United States is not to try to reach the sodium intake levels of primitive societies. Although the INTERSALT data cited in the comment on the relationship between sodium and blood pressure were generally inconclusive when the four populations with the lowest sodium intakes were excluded, the data on the relationship between sodium intake and trends in blood pressure with age remained positive and significant.

The definition of "low sodium" requires that foods contain less than 140 mg sodium per reference amount and per 50 g for foods with reference amounts of 30 g or less or 2 tablespoons or less. The "per 50 g" criterion is a change from the proposed criterion of "per 100 g," and this change is discussed in further detail in the final rule on general requirements for nutrient content claims, which is published elsewhere in this issue of the Federal Register.

In the companion document on general requirements for health claims, FDA is also prohibiting claims on foods lacking naturally occurring nutrients (i.e., in order to bear health claims, foods must naturally contain a minimum of 10 percent of the RDI or DRV for one of six specified nutrients: Protein, fiber, vitamin A, vitamin C, calcium, and iron). The changes in the qualifying criteria for "low sodium," in the disqualifying levels for fat, saturated fat, and cholesterol, and in the restrictions to foods with naturally occurring nutrients have resulted in the qualification of some additional foods for sodium/hypertension health claims and the disqualification of foods lacking significant naturally occurring nutrients. Examples of foods that may bear sodium/hypertension claims include several additional fish and shellfish products, egg substitutes, and a few skim milk cheeses. Examples of foods that would have qualified for health claims under the proposed rules but no longer qualify include beverages such as carbonated soft drinks, coffees, and teas; most candies, cookies, baked goods, and icings; margarines and salad dressings; sweeteners; most jams and jellies; a few canned fruits; and a few canned and raw vegetables.

22. One comment argued that foods allowed to bear sodium/hypertension health claims should have a calorie restriction, since obesity is a risk factor for high blood pressure.

FDA disagrees. Sodium/hypertension health claims are intended for the general population and not merely for those who need to restrict their caloric intake. It would be a disservice to restrict health claims to low calorie foods, since many people who are at risk for high blood pressure and can benefit from consuming foods that are low in sodium may not need to consume foods low in calories. In addition, although everyone is encouraged to consume a diet low in sodium, individuals can select a variety of foods with different sodium and calorie contents to meet their dietary needs.

23. Some comments approved of the model health claim message. Others expressed concern that, by including too much information, claims would become overly burdensome and ineffective and would discourage manufacturers from using them and consumers from reading them. One comment suggested a simpler claim: "A low sodium diet can help to lower blood pressure in some people with high blood pressure."

FDA appreciates the concern about long and burdensome messages and has discussed this issue in the final rule on general requirements for health claims published elsewhere in this issue of the Federal Register. Upon reconsideration, the agency has made several changes that will simplify claims and limit the amount of required information, while assuring that claims are clear and nonmisleading to consumers. The proposed regulation would have imposed the following requirements on health claims: "The health claim states that a low sodium diet is associated with or related to lower blood pressure in some people. Alternatively, the health claim can state that a high sodium diet is associated with or related to higher blood pressure in some people" (proposed § 101.74(c)(2)); and "The health claim identifies the populations at greatest risk of developing high blood pressure as being the elderly and those with family histories of high blood pressure and states that other dietary risk factors associated with high blood pressure include alcohol consumption and excess weight" (proposed § 101.74(c)(3)).

These requirements have been simplified to require that claims use the words "may" or "might" (§ 101.74(c)(2)(i)(A)) (see comment 18 of this document); that the disease and nutrient terms be "high blood pressure" (§ 101.74(c)(2)(i)(B)), and "sodium" (§ 101.74(c)(2)(i)(C)), respectively (this is consistent with the proposed rule); and that claims not state any degree of risk reduction (§ 101.74(c)(2)(i)(D)) (see comment 26 of this document). The agency believes that simplifying the relationship statement will make the message shorter and easier for consumers to understand. In order to be consistent with other regulations, FDA has used wording associating diets low in sodium "to reduced risk of high blood pressure" rather than the wording suggested in the comment "to lower blood pressure." This phrasing more accurately captures the relationship

between sodium intake and high blood pressure than the proposal, which would have permitted claims to note the "association" or "relation" of sodium to blood pressure. In addition, as discussed in comment 18 of this document, the wording "in some people" has been deleted.

24. One comment opposed identifying specific risk populations in health claims and argued that other populations would assume they do not need to be concerned. Others argued that the inclusion of risk populations and dietary risk factors made claims too long and burdensome. Still others provided data on other dietary factors, such as the potassium, calcium, magnesium, or chloride ion content or the ratio of sodium to potassium (Refs. 15, 19, 21, 24, 26, 28, 32, 36, 39, 61, 65, 66, 67, 73, 77, 86, 88, 101, 110, and 115) or suggested that these other dietary factors should be discussed and acknowledged in health claims as dietary risk factors.

FDA recognizes that high blood pressure is a multifactorial disease and that research has indicated that other nutrients may be associated with high blood pressure. However, in the 1990 amendments, Congress directed the agency to evaluate, within a short period of time, the relationship between sodium and hypertension. Thus, FDA's present assessment of the scientific evidence is limited to this relationship. References in a sodium/hypertension health claim to other specified nutrients would constitute a health claim for these nutrients and would not be allowed unless authorized through the petition process set out in the final rule on general requirements for health claims, published elsewhere in this issue of the Federal Register.

FDA is concerned that allowing the unrestricted listing of risk factors for high blood pressure other than sodium intakes could result in risk factors of little relative importance or with minimal scientific support being included on labels. Depending on the context in which they are discussed, information on risk factors other than sodium can be misleading. However, the agency is also concerned that consumers could be misled into overemphasizing the impact of sodium on blood pressure or into believing that high blood pressure can be controlled by sodium restriction alone. Proposed § 101.74(c)(3) would have required health claims to include information identifying populations at greatest risk of developing hypertension and other risk factors associated with high blood pressure.

Upon reconsideration, FDA has chosen to limit the mandatory health claim requirement for sodium and hypertension to a short statement containing the minimum essential information and to allow additional information on an optional basis. Under the final regulation, claims must indicate that the development of high blood pressure depends on many factors. This requirement is intended to prevent consumers from being misled that sodium intake alone is connected with high blood pressure. However, in order to permit shorter claims, the final regulation dose not require that specific risk factors be identified. FDA has listed major risk factors for which there is general scientific agreement in § 101.74(d)(1). Under that section, a claim "may identify one or more of the following risk factors for development of high blood pressure in addition to dietary sodium consumption: family history of high blood pressure, growing older, alcohol consumption, and excess weight." FDA encourages manufactures to provide useful and accurate information on risk factors, but advises that, if specific information about disease risk is included in health claims, then the information must of course be presented in a truthful and nonmisleading manner.

VI. Optional Information

25. One comment supported encouraging 2,400 mg sodium as a maximum intake recommendation for the public at large, and another agreed that current intakes of sodium are well in excess of need and recommendations. Another comment strongly opposed including a statement that sodium intake should not exceed 2,400 mg, indicating that this value is a reference level, not a maximum intake level.

In response to comments urging the agency to shorten health claims and to provide more consistent regulations, FDA has decided to retain this information, but to move it to the significance statement. While most people should target their sodium intakes within the 500 to 2,400 mg range, a very few individuals may need more than the minimum because of excessive sweat losses, and some high calorie consumers may find 2,400 mg impossible to meet. Section 101.74(d)(2) will permit the inclusion of information from the significance statement in a health claim. Consequently, proposed § 101.74(d)(1) has been deleted, and the following sentence has been added to the significance statement in § 101.74(b)(4): "Sodium is an essential nutrient, and experts have recommended a safe minimum level of 500 mg sodium per day and a upper level of 2,400 mg sodium per day, the FDA Daily Value for sodium."

26. Comments from both health professionals and trade associations strongly supported requiring that sodium/hypertension health claims contain a statement that individuals with high blood pressure should consult their physicians for medical advice and treatment. There were no comments opposing this statement or requesting that it remain optional, as proposed, although some comments expressed general objections to the length of health claims.

In the proposal, FDA expressed concern that some people might attempt to use the ready availability of sodium labeling, and in particular sodium/hypertension health claims, to self-medicate or treat their hypertension without consulting a physician, especially since many people are aware of the dangers of hypertension (Ref. 56) and can easily learn their blood pressure levels by visiting a health professional or using "do it yourself" machines in grocery stores or shopping malls. Requiring the statement about physician consultations as part of the health claim might give consumers the erroneous impression that there is no benefit in making recommended dietary changes unless they have been identified as hypertensive. On the other hand, FDA remains concerned about hypertensives foregoing needed medical diagnosis and treatment. Specifically, definitions of hypertension or normotension in terms of blood pressure readings could encourage self-diagnosis, and information relating specific sodium intakes to specific reductions in blood pressure could encourage self-treatment. To decrease the likelihood of self-diagnosis or treatment based on health claims, in new § 101.74(c)(2)(i)(D) FDA has specifically prohibited claims from including any information on the degree of risk reduction for high blood pressure associated with sodium reduction. The agency has also has removed the following quantitative statements from the significance statement in new § 101.74(b):

> Estimates suggest that reducing sodium intake by 100 millimoles (mmol) per day (2,300 mg of sodium or approximately one rounded teaspoon of salt) would correspond to an average lowering of blood pressure of approximately 2.2 mm Hg systolic and 0.1 mm Hg diastolic. Because these are population-wide estimates, the magnitude of the effect for sensitive individuals would be greater. Estimates suggest that, for the age range from 25 to 55, a 100 mmol per day (2,300 milligrams (mg) per day) lower lifetime intake of sodium would correspond to a reduction in mortality rates of

approximately 16 percent for coronary heart disease and 23 percent for stroke.

FDA has decided to limit the information required in health claims to that which is essential. Therefore, the agency has retained the physician consultation statement as optional information, § 101.74(d)(7). However, should manufacturers choose to include information that could increase the likelihood of consumers self-diagnosing or self-treating their hypertension, that information must be presented in a clear and nonmisleading manner. For example, claims should not overemphasize the importance of sodium in reducing blood pressure. In addition, should manufacturers include specific information that would assist consumers in self-diagnosing their hypertension, such as definitions of either high or normal blood pressure, then the physician consultation statement would be mandatory, and this requirement has been included in new § 101.74(d)(7):

> The claim may state that individuals with high blood pressure should consult their physicians for medical advice and treatment. If the claim defines high or normal blood pressure, then the health claim must state that individuals with high blood pressure should consult their physicians for medical advice and treatment.

Because high blood pressure is a serious disease that often has no outwardly observable symptoms, FDA encourages manufacturers to include a physician referral statement as a public service, and requires it when health claims include information that could encourage self-diagnosis or treatment.

27. The agency proposed to permit the optional use of the term "salt" in addition to the term "sodium" in health claims. However, because of recent studies, and the increasing body of evidence identifying sodium chloride rather than sodium alone as the active substance in affecting blood pressure, the agency specifically requested comments regarding the appropriateness of selecting sodium rather than sodium chloride as the specified nutrient and on allowing the term "salt" in addition to the term "sodium" in health claims. One comment objected to allowing the term "salt" in addition to the term "sodium," arguing that FDA policies have been based on sodium, that the 1990 amendments specify sodium, that it would be arbitrary and capricious to indicate sodium chloride without providing a scientific basis, that consumers would consider the two interchangeably, and that it would undermine previous education efforts. Other comments provided data on sodium salts other than sodium chloride and argued that the effect of sodium on blood pressure was due not to sodium alone but rather to sodium in combination with chloride. One comment noted that only studies involving sodium as the chloride salt have resulted in demonstrable increases in blood pressure. The comment urged the agency to permit salt/hypertension health claims and not sodium/hypertension health claims. The FASEB report (Ref. 138) concluded that "the impact of dietary sodium on blood pressure depends on the provision of sodium as the chloride."

After considering the comments and data submitted in response to the proposed rule, FDA has concluded that these issues are very complex. Salt or sodium chloride is the major source of sodium in foods, and over the years most of the studies investigating the effect of sodium on blood pressure have involved either increasing or decreasing sodium chloride intake (56 FR 60825, Table 2, Refs. 44, 45, 80, 109, 121, 122). Many dietary guidance discussions, policies, and recommendations refer to both sodium and salt (Refs. 43, 62, and 85), and the use of the term "salt" would make claims more understandable to many people. For these reasons, the agency has decided to make final its proposal to permit the optional use of the term "salt" in addition to "sodium."

FDA acknowledges that some studies and reviews indicate that sodium chloride and other sodium salts have distinct effects on blood pressure (Refs. 31, 43, 48, 79, 87, and 92). The agency recognizes that, if it is true that "salt" and not "sodium" is implicated in high blood pressure, products containing other sources of sodium may be incorrectly considered to promote high blood pressure. At present, however, there is not significant scientific agreement that only sodium chloride affects blood pressure, as evidenced by the fact that authoritative documents have not limited their recommendations to salt. Limiting health claims to "salt" would represent a significant policy change and would have implications for many other regulations. FDA has therefore concluded that a thorough review of all the data and an opportunity for public comment are required before such a shift. If concerned parties believe that, based on the totality of the publicly available scientific evidence, there is significant scientific agreement that sodium chloride, and not just sodium, is associated with high blood pressure, they should petition the agency for a change in the regulation.

28. No comments were received regarding FDA's tentative decision to allow the term "hypertension" in addition to the term "high blood pressure." Consequently, FDA has retained this provision in the optional information section of the regulation, although the numbering has changed from § 101.74(d)(4) to (d)(5).

29. Comments to the public docket on sodium and hypertension strongly supported Consumer Summaries. One comment recommended developing additional summaries to target specific audiences. A few comments suggested specific changes in the wording provided in the proposed rule. However, comments to the public docket for the general requirements for health claims generally opposed Consumer Summaries.

FDA acknowledges the interest expressed by comments in the consumer summaries. However, the agency has been persuaded by the comments received overall relative to health claims (See the general requirements for health claims final rule published elsewhere in this Federal Register). FDA notes that considerable educational efforts are planned and Consumer Summaries as part of the preamble and not in the codified language had limited utility.

VII. Model Health Claims

30. Several comments approved the model health claim for sodium and hypertension. Others objected to its length or to specific required information, and these comments have been addressed in comments 18, 23, 24, and 27 of this document. FDA has provided new model health claims to illustrate changes made in the proposed regulations.

VIII. Additional Scientific Data

To assure that significant new evidence had not become available subsequent to the proposal, FDA updated its review of the scientific evidence with human studies that were directly relevant to the proposed rule or became available after publication of its proposal (see Table).

A. Review of Scientific Studies and Data

1. Relationship of sodium intake to blood pressure

Pavek and Pavek (Ref. 146) conducted an intervention study in 35 mild, untreated hypertensives (15 males, 20 females) to determine the blood pressure sensitivity to 72-hour salt depletion achieved through a low salt diet consisting of unprocessed rice, potatoes, fruits, vegetables, and 2 liters (L) of tap water. Oscillometric,

auscultatory, and ambulatory blood pressure measurements were taken, and sodium intake was determined by 24-hour urine collections. Average 24-hour urinary sodium decreased by 17.5 mmol (400 mg), and average body weight by 3.1 percent. Average SBP decreased significantly (Oscillometric: 147.3 to 134.8 mm Hg; Auscultatory: 148.0 to 134.4 mm Hg; and Ambulatory Oscillometric: 138.6 to 130.4 mm Hg). Average DBP changed little, and only oscillometric measurements were statistically significant. Determination of individual salt sensitivity varied greatly and depended on the type of blood pressure measurement considered.

Dustan and Kirk (Ref. 125) investigated the effect of sodium depletion (9 meq or 210 mg sodium diet) followed by sodium loading (9 meq or 210 mg sodium plus 3.88 meq or 90 mg sodium per kilogram (kg)) in 51 normotensive white (19 male, 32 female), 18 normotensive black (7 male, 16 female), and 21 hypertensive black (5 male, 16 female) patients and the effect of sodium loading followed by sodium depletion in 11 normotensive white (2 male, 9 female), 16 normotensive black (6 male, 10 female), and 19 hypertensive black (4 male, 15 female) patients. The order of sodium loading and depletion did not affect mean arterial pressure in normotensive white patients (blood pressure did not vary) or in hypertensive black patients (blood pressure rose during sodium loading and fell during sodium depletion). Mean arterial pressure in normotensive black patients did not vary when sodium depletion was followed by sodium loading, but when the order was reversed, mean arterial pressure fell during sodium depletion and rose during sodium loading.

A study by Elliott et al. (Ref. 126) analyzed data collected as part of a random sample of 58 subjects aged 40 or above (29 male, 29 female) from a North London population that included diabetics (6 subjects) and individuals taking antihypertensive medication (5 subjects) or diuretics (3 subjects). SBP was significantly and positively related to 24-hour urinary sodium excretion and remained significant after adjustment for age, sex, and body mass index. DBP was significantly related to 24-hour urinary sodium excretion; however, the significance was borderline after adjustment for age and sex and insignificant after additional adjustment for body mass index. The reliability of complete 24-hour urine collection was monitored by para-aminobenzoic acid, and the significance of the results was greater in the subgroup identified as having the most complete urine collections. The within-individual variation in sodium intake was estimated from data on 11 subjects who completed two 24-hour collections. A reduction of 50 mmol (1,150 mg) sodium was associated with lower SBP and DBP of 5.3 and 1.4 mm Hg, respectively.

Khaw and Barrett-Conner (Ref. 128) examined the relationship between blood pressure and sodium estimated from dietary recall data in upper middle class white Southern Californian subjects (584 men and 718 women). Age-adjusted SBP and DBP correlated significantly with dietary sodium intake in men but not in women and with the sodium/potassium ratio in both men and women. The relationship persisted over the entire range of blood pressures and dietary intakes. The authors concluded that the results support the hypothesis that dietary sodium and potassium are related to blood pressure within a population.

He et al. (Ref. 139) investigated the relationship of 4 dietary ions, including sodium, to blood pressure in 4 population groups of Southern Chinese men from the Sichuan Province: 119 Yi farmers from remote villages in the high mountains, 114 Yi farmers from lower elevation, mountainside villages, 89 Yi people who had migrated to the county seat, and 97 Han people who were native residents of the county seat. Dietary and urinary sodium were significantly and positively correlated with SBP and DBP, even after controlling for age, body mass index, heart rate, alcohol, and total energy intake. Analysis at the individual level confirmed these results.

Forte et al. (Ref. 132) studied the effect of a health education program on salt reduction and blood pressure response in two matched rural Portuguese communities (150 of approximately 800 subjects studied in each community) with initially high daily salt intakes (360 mmol or 8,300 mg sodium). The health education program in the intervention community emphasized adding less salt in the kitchen, eating less cod fish and fewer sausages, and adding less salt to home-baked bread. In addition, local bakers were asked to reduce the salt added to bread by 50 percent during the 2-year trial. Mean sodium intake fell in the intervention community (364 mmol or 8,370 mg to 202 mmol or 4,640 mg) and rose slightly in the control community (352 mmol or 8,100 mg to 371 mmol or 8,530 mg). In the intervention community, average blood pressure decreased (SBP: decrease of 3.6 mm Hg at one year and 5.0 mm Hg at 2 years, DBP: decrease of 5.0 mm Hg at 1 year and 5.1 mm Hg DBP at 2 years); however, in the control community, average SBP rose and DBP remained constant.

2. Risk factors for high blood pressure

Beretta-Piccoli (Ref. 134) studied total exchangeable sodium in 62 normotensive (SBP < 130 mm Hg, DBP < 90 mm Hg) Swiss males with and without a family history of hypertension (31 subjects each, matched by age, height, and weight) on a normal daily sodium intake (150 mmol or 3,400 mg) and, in a subgroup of 23 subjects (13 with and 10 without a family history of hypertension), Beretta-Piccoli studied the adaptation of exchangeable sodium to variations in dietary sodium intake (low urinary sodium of 17 mmol or 390 mg versus high urinary sodium of 270 mmol or 6,200 mg). In the first, matched study, blood pressures tended to be higher in the group with a family history of high blood pressure. In the second, subgroup study, blood pressures increased with sodium intake in all subjects, but the magnitude of increase was greater in subjects with a family history of hypertension (SBP: 119 to 126 mm Hg, DBP: 76 to 80 mm Hg) than in those without (SBP: 112 to 113 mm Hg, DBP: 69 to 71 mm Hg).

3. Hypertensives versus normotensives

In addition to the Dustan study (Ref. 125) considered above, two additional studies investigated differences in responses for hypertensives and normotensives. Gill et al. (Ref. 127) investigated various hormonal changes in response to various dietary sodium levels. The study classified 19 patients with normal renin idiopathic hypertension as salt-sensitive (mean arterial pressure increases of 8 to 14 percent) (8 patients) or salt-resistant (mean arterial pressure changes from −7 to +7 percent) (11 patients) as compared with 5 normotensive subjects (mean arterial pressure changes from −3 to +7 percent). Subjects were fed a constant isocaloric diet supplemented with sodium chloride to provide 3 dietary levels of sodium intake: 9 meq (200 mg), 109 meq (2,500 mg), and 249 meq (5,700 mg). Average mean arterial blood pressures on the low sodium relative to the high sodium diet changed from 79 to 83 mm Hg in the normotensive subjects, from 104 to 114 mm Hg in the salt-sensitive hypertensive patients, and remained balanced at 114 mm Hg in the salt-resistant hypertensive patients.

Weinberger and Fineberg (Ref. 141) conducted 3 studies in Indiana. The first investigated the reproducibility of determining salt-sensitivity in 28

normotensive (BP < 140/90) and hypertensive (antihypertension therapy or BP ≤ 140/90 on at least 3 occasions) subjects. Salt-sensitivity was defined in terms of response to sodium chloride infusion (change from 2 L of 0.9 percent sodium chloride to 10 mmol or 230 mg sodium per day) where mean arterial blood pressure responses of 10 mm Hg or greater, of 5 mm Hg or less, and of 6 to 10 mm Hg were classified as salt-sensitive, salt-resistant, and indeterminant, respectively. The authors reported that the majority (18 of 28) were consistent in their responses. The second study investigated the influence of age on blood pressure response to the salt-sensitivity procedure described above in 430 normotensive and 230 hypertensive subjects. Sodium sensitivity increased progressively with age in hypertensive subjects but not in normotensive subjects until they reached 60 years of age and older. The third study assessed changes in blood pressure over 10 or more years in subjects classified initially using the salt-sensitivity procedure described above: 13 hypertensives (10 salt-senstive, 3 salt-resistant) and 18 normotensives (6 salt-sensitive, 12 salt-resistant).

4. Salt sensitivity

In addition to the Gill study (Ref. 127) and the Weinberger study (Ref. 141) considered above, two other studies investigated the salt sensitivity issue. Sullivan et al. (Ref. 130) studied 65 borderline hypertensive (DBP generally below 90 mm Hg but greater than 90 mm Hg on at least 3 occasions) and 92 normotensive subjects to investigate different characteristics of sodium-sensitive and sodium-resistant individuals. Many parameters were studied while subjects followed their usual diets, 10 meq (230 mg) sodium/60 meq potassium diets, and 200 meq (4,600 mg) sodium per 60 meq potassium diets. Sodium sensitivity was defined as a 5 percent increase in blood pressure between the low sodium and the high sodium states; the prevalence of sodium sensitivity was higher in blacks (27 percent of normotensives and 50 percent of borderline hypertensives) than in whites (15 percent of normotensives and 29 percent of borderline hypertensives). Sodium depletion and repletion had a variable effect on blood pressure, and mean blood pressure rose 6.5 percent in those identified as sodium sensitive as compared with 0 percent in those identified as sodium resistant.

Espinel (Ref. 143) conducted a 3-phase dietary salt intervention trial to characterize the response of 30 well-established adult hypertensive patients (DBP greater than 90 mm Hg) to dietary salt. The unrestricted-salt phase certified the presence of hypertension and documented the customary salt intake. The restricted-salt phase (2 g salt) (<34 mmol salt or 780 mg sodium) identified 13 patients, who were considered salt-sensitive, who could control their DBP (below 90 mm Hg) on a salt-restricted diet containing less than 2 g salt per day (SBP: from 177.1 to 145.1 mm Hg; DBP: from 105.4 to 82.0 mm Hg). The blood pressures of the remaining patients were reduced as well (SBP: from 173.3 to 164.1 mm Hg; DBP: from 102.9 to 98.2 mm Hg) but not enough to return to normotensive levels. In the salt-step phase, salt was added to the diet established during the restricted-salt phase in a stepwise manner (increases of 1 g salt or 390 mg sodium; each step lasting at least 3 days) to determine the level of salt that triggered hypertension in individual patients. This level was termed the Salt Hypertension Threshold for that patient and in the 13 patients ranged from 3 to 16 g salt (1,200 to 6,200 mg sodium) per day. The test was repeated between 2 months and 1 1/2 years later and the results remained stable and reproducible.

5. Long-term effect

The results of an 18-month trial on normotensives, the TOHP Collaborative Research Group study abstract (Ref. 123) was included in the proposed regulation, and the final study results are summarized here (Ref. 145). The TOHP Collaborative Research Group study included 7 nonpharmacologic interventions, 3 life-style changes (weight reduction, sodium reduction, and stress management), and 4 nutritional supplements (calcium, magnesium, potassium, and fish oil) in 2,182 normotensive (DBP from 80 to 89 mm Hg) subjects (70 percent male). The sodium-reduction intervention emphasized shopping, cooking, and food selection behavior aimed at reducing sodium intake, and at 18 months had achieved average daily reductions of 55.19 mmol sodium (1,270 mg) as compared to 11.33 mmol sodium (260 mg) in the control group from initial baseline values of 154.6 mmol (3,550 mg) and 156.4 mmol (3,600 mg) in the two groups, respectively. Statistically significant average decreases in blood pressure were reported in the intervention group as compared with the control group for both DBP (decrease of 0.9 mm Hg) and SBP (decrease of 1.7 mm Hg).

Joosens and Kesteloot (Ref. 147) reanalyzed data from 3,328 subjects collected as part of 6 Belgian surveys conducted between 1967 and 1986. Six of the surveys included blood pressure data and five included 24-hour sodium excretion data. Between 1967 and 1986, the mean standardized sodium excretion decreased from 265 to 160 mmol in men (6,100 to 3,700 mg) and from 208 to 160 mmol in women (4,800 to 3,700 mg). Mean SBP decreased from 169 to 142 mm Hg in men and from 171 to 147 mm Hg in women. The prevalence of hypertension (SBP > 159 mm Hg) decreased from 51 to 21 percent in men and from 66 to 22 percent in women, and severe hypertension (SBP > 220 mm Hg) nearly disappeared. During the same period, body mass index increased 1.1 kg/m^2 in men and was unchanged in women. Since increased weight is associated with increases in blood pressure, the observed decreases in blood pressure could not be ascribed to changes in weight. The proportion of subjects receiving treatment for hypertension increased from 10 to 36 percent in men and from 18 to 41 percent in women. The increased treatment would account for some of the observed decreases in blood pressure, but the authors concluded that treatment alone could not account for all of the observed changes in blood pressure. The authors used the correlation between sodium intake and blood pressure from the INTERSALT study (Ref. 37) and the observed decrease in sodium intake ln Belgium from 1967 to 1986 in order to estimate the expected corresponding decrease in SBP. Considered together, the increase in treatment and the decrease in sodium intake were considered sufficient to explain the observed decreases in blood pressure. Methodologies in the six studies were similar but not identical, adding to the uncertainties.

6. Sodium chloride versus other sodium salts

Shore et al. (Ref. 129) conducted a randomized, crossover study to investigate the blood pressure response of six hypertensives (DBP between 90 to 110 mm Hg) on low sodium diets of 10 mmol (230 mg) sodium and 80 mmol potassium with the addition of either sodium chloride (120 mmol or 2,760 mg total daily sodium) or sodium potassium (122 mmol or 2,800 mg total daily sodium). Urinary sodium excretion was similar during both periods. However, blood pressures increased when sodium chloride was added to the diet, but not when sodium phosphate was added.

7. Effect on medication requirements

Weinberger et al. (Ref. 131) investigated whether free-living

hypertensive patients could reduce their medication by individualized dietary counseling aimed at moderately reducing their dietary sodium intake. Only 98 of the original 114 individuals completed the study and maintained significant reductions in mean sodium intake for 30 weeks. Those who achieved the 80 mmol (1,800 mg) sodium goal were more likely to have a reduction in a number of medications than those not reaching the goal.

In an observer-blind, controlled trial, Little et al. (Ref. 140) compared the effect of a low sodium, low fat, high fiber diet against the individual components of the diet in reducing the amount of antihypertensive medication required by 196 patients with established hypertension. Medication reductions were 64 percent and significant on the combination diet, 45 percent and insignificant on the low sodium diet, and 33 percent on the control diet; 57.5 percent of patients on the combination diet stopped all medication as compared with 24 percent on the control diet.

8. Effect of sodium intake on medicated patients

Carney et al. (Ref. 136) used a randomized, double-blind, crossover study design to investigate the effect of 100 mmol (2,300 mg) of sodium chloride on blood pressure control in 11 patients with mild to moderate hypertension successfully treated with various hypotensive agents. No significant changes in supine or erect blood pressure were observed in these medicated patients.

9. Studies in children

An intervention study by Ellison et al. (Ref. 148) involved reducing the sodium intake of students by 15 to 20 percent through changes in food purchasing and preparation practices in two boarding high schools. Each school served alternately as the control or the intervention school for one school year. Early in the year, blood pressures increased above baseline; however, as the year progressed blood pressures in the intervention school dropped and remained below baseline. The average SBP and DBP, adjusted for sex and initial blood pressure, were reduced by 1.7 and 1.5 mm Hg, respectively, on the low sodium diet when measured from the beginning to the end of the school year. Changes in sodium intake were calculated from 24-hour food diaries completed periodically during the year, and no independent measurements were made to document changes in sodium intake.

A longitudinal study by Geleijnse et al. (Ref. 149) collected blood pressure and electrolyte data annually from 233 Netherlands children ranging in age from 5 to 17 years old (108 boys, 125 girls) for an average period of 7 years in order to investigate the association between sodium and potassium intake and the change in blood pressure over time. No significant association between sodium intake and the change in blood pressure over time was observed. Mean 24-hour sodium intakes were calculated values and were based on six timed, overnight urine collections.

Miller et al. (Ref. 150) conducted an intervention study in Indiana with 64 male and 84 female white, normotensive children to determine if modest dietary restriction in childhood results in heterogeneous changes in blood pressure response. Families received instruction to assist them in restricting their dietary sodium to 60 mmol (1,380 mg) per day. Average sodium decreased from 112.9 mmol (2,600 mg) to 53.4 mmol (1,230 mg) in boys and from 91.1 mmol (2,090 mg) to 41.1 mmol (940 mg) in girls. Changes in SBP were not significant for either boys or girls, but girls showed a decrease in DBP ($p<0.05$) and in mean arterial pressure.

Rocchini et al. (Ref. 133) studied blood pressure changes in 60 obese and 18 nonobese adolescents (10 to 16 years of age) on high salt diets (> 250 mmol or 5,700 mg sodium) per day and low salt diets (< 30 mmol or 700 mg sodium) per day with the caloric content held constant. In the obese adolescents, there was a statistically significant decrease in blood pressure on the low sodium diet (mean arterial pressure change from 92 to 80 mg Hg), but no significant change was observed in the nonobese adolescents (mean arterial pressure change from 76 to 77 mm Hg). The study was repeated on 51 of the obese adolescents after 20-week weight loss program. The 36 subjects who lost at least 1 kg of body weight (average weight loss 7.5 kg) had a reduced sensitivity of blood pressure to sodium (mean arterial pressure change from 82 to 81 mm Hg) as compared to the 15 subjects who lost less than 1 kg of body weight (mean arterial pressure change from 89 to 79 mm Hg).

B. Conclusions from Scientific Studies and Data

In assessing the new scientific evidence, FDA has considered whether the evidence significantly challenges any of its tentative conclusions presented in the proposed rule.

The agency has determined that, although one study was inconclusive (Ref. 125), the scientific evidence continues to support a relationship between sodium and hypertension in adults (Refs. 123, 126, 127, 128, 132, 134, 139, 141, 146, and 147). In particular, the 3-year study on nonpharmacologic interventions (Ref. 145) strengthens previously limited evidence on the benefits of long-term sodium reduction in reducing blood pressure. In addition, the Espinel study (Ref. 143) demonstrates the wide variability in blood pressure response to sodium and the long-term individual reproducibility. The studies on children sometimes showed an effect (Ref. 148), sometimes showed no effect (Ref. 149), and sometimes showed an effect in certain population subgroups but not in others (Refs. 133 and 150). The one study involving a nonchloride sodium salt (Ref. 129) showed an effect for sodium chloride but not for sodium phosphate, which supports the contention that sodium chloride and not sodium per se is important in blood pressure response (see comment 27 of this document).

In conclusion, the new scientific evidence strengthens the conclusion reached in the proposed regulation that, based on the totality of the scientific evidence, there is significant scientific agreement that the evidence supports health claims that diets low in salt and sodium may help lower blood pressure in many people.

IX. Conclusions

FDA has responded to all comments received in response to the proposed sodium/hypertension health claim regulation. In addition, the agency has reviewed all additional scientific studies received in comments or independently identified and has determined that the new studies strengthen the conclusions reached in the proposed regulation. After considering the comments and the new scientific studies, the agency concludes that health claims for sodium and hypertension should be authorized.

The agency has decided that the regulations for the authorized health claims are most useful if they follow a consistent format and require only information that the agency considers essential. Therefore, the agency has made a number of editorial changes in the proposed codified material of the sodium and hypertension health claim to make it more consistent with other authorized claims.

X. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole,

would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

XI. Environmental Impact

The agency has determined that, under 21 CFR 25.24(a)(11), this action is of a type that does not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

List of Subjects in 21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 101 is amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6, of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.74 is added to subpart E to read as follows:

§ 101.74 Health claims: sodium and hypertension.

(a) *Relationship between sodium and hypertension (high blood pressure).* (1) Hypertension, or high blood pressure, generally means a systolic blood pressure of greater than 140 millimeters of mercury (mm Hg) or a diastolic blood pressure of greater than 90 mm Hg. Normotension, or normal blood pressure, is a systolic blood pressure below 140 mm Hg and diastolic blood pressure below 90 mm Hg. Sodium is specified here as the chemical entity or electrolyte "sodium" and is distinguished from sodium chloride, or salt, which is 39 percent sodium by weight.

(2) The scientific evidence establishes that diets high in sodium are associated with a high prevalence of hypertension or high blood pressure and with increases in blood pressure with age, and that diets low in sodium are associated with a low prevalence of hypertension or high blood pressure and with a low or no increase of blood pressure with age.

(b) *Significance of sodium in relation to high blood pressure.* (1) High blood pressure is a public health concern primarily because it is a major risk factor for mortality from coronary heart disease and stroke. Early management of high blood pressure is a major public health goal that can assist in reducing mortality associated with coronary heart disease and stroke. There is a continuum of mortality risk that increases as blood pressures rise. Individuals with high blood pressure

are at greatest risk, and individuals with moderately high, high normal, and normal blood pressure are at steadily decreasing risk. The scientific evidence indicates that reducing sodium intake lowers blood pressure and associated risks in many but not all hypertensive individuals. There is also evidence that reducing sodium intake lowers blood pressure and associated risks in many but not all normotensive individuals as well.

(2) The populations at greatest risk for high blood pressure, and those most likely to benefit from sodium reduction, include those with family histories of high blood pressure, the elderly, males because they develop hypertension earlier in life than females, and black males and females. Although some population groups are at greater risk than others, high blood-pressure is a disease of public health concern for all population groups. Sodium intake, alcohol consumption, and obesity are identified risk factors for high blood pressure.

(3) Sodium intakes exceed recommended levels in almost every group in the United States. One of the major public health recommendations relative to high blood pressure is to decrease consumption of salt. On a population-wide basis, reducing the average sodium intake would have a small but significant effect on reducing the average blood pressure, and, consequently, reducing mortality from cardiovascular disease and stroke.

(4) Sodium is an essential nutrient, and experts have recommended a safe minimum level of 500 milligrams (mg) sodium per day and an upper level of 2,400 mg sodium per day, the FDA Daily Value for sodium.

(c) *Requirements.* (1) All requirements set forth in § 101.14 shall be met.

(2) Specific requirements. (i) *Nature of the claim.* A health claim associating diets low in sodium with reduced risk of high blood pressure may be made on the label or labeling of a food described in paragraph (c)(2)(ii) of this section, provided that:

(A) The claim states that diets low in sodium "may" or "might" reduce the risk of high blood pressure;

(B) In specifying the disease, the claim uses the term "high blood pressure";

(C) In specifying the nutrient, the claim uses the term "sodium";

(D) The claim does not attribute any degree of reduction in risk of high blood pressure to diets low in sodium; and

(E) The claim indicates that development of high blood pressure depends on many factors.

(ii) *Nature of the food.* The food shall meet all of the nutrient content requirements of § 101.61 for a "low sodium" food.

(d) *Optional information.* (1) The claim may identify one or more of the following risk factors for development of high blood pressure in addition to dietary sodium consumption: Family history of high blood pressure, growing older, alcohol consumption, and excess weight.

(2) The claim may include information from paragraphs (a) and (b) of this section, which summarizes the relationship between dietary sodium and high blood pressure and the significance of the relationship.

(3) The claim may include information on the number of people in the United States who have high blood pressure. The sources of this information must be identified, and it must be current information from the National Center for Health Statistics, the National Institutes of Health, or "Nutrition and Your Health: Dietary Guidelines for Americans," U.S. Department of Health and Human Services (DHHS) and U.S. Department of Agriculture (USDA), Government Printing Office.

(4) The claim may indicate that it is consistent with "Nutrition and Your Health: U.S. Dietary Guidelines for Americans, DHHS and USDA, Government Printing Office.

(5) In specifying the nutrient, the claim may include the term "salt" in addition to the term "sodium."

(6) In specifying the disease, the claim may include the term "hypertension" in addition to the term "high blood pressure."

(7) The claim may state that individuals with high blood pressure should consult their physicians for medical advice and treatment. If the claim defines high or normal blood pressure, then the health claim must state that individuals with high blood pressure should consult their physicians for medical advice and treatment.

(e) *Model health claims.* The following are model health claims that may be used in food labeling to describe the relationship between dietary sodium and high blood pressure:

(1) Diets low in sodium may reduce the risk of high blood pressure, a disease associated with many factors.

(2) Development of hypertension or high blood pressure depends on many factors. [This product] can be part of a low sodium, low salt diet that might reduce the risk of hypertension or high blood pressure.

Dated: December 17, 1992.

David A. Kessler,

Commissioner of Food and Drugs.

Louis W. Sullivan,

Secretary of Health and Human Services.

Note: The following table will not appear in the annual Code of Federal Regulations.

BILLING CODE 4160-01-F

TABLE

Sodium/Hypert

Study	Study Design	Subjects	Method
Beretta-Piccoli (1990) (Ref. 134)	Survey of exchangeable body sodium (Na) in normotensive men with and without a family history of hypertension Study done in Switzerland	62 healthy, normotensive males (SBP < 130 mm Hg, DBP < 90 mm Hg) (31 with a family history of hypertension, 31 without a family history of hypertension) Subjects matched by age, height, and weight Subgroup of 23 (13 with and 10 without a family history of hypertension)	Mean total exchange measured by isotope The study of exchang the total group was with subjects on a intake (150 mmol or day) The adaptation of e to variations in di intake, carried out subgroup, involved measurements at the day low-salt phase 390 mg per day) and high-salt phase (27 6,200 mg per day)

63

ABLE

ypertension

ethods	Results	Comments
hangeable Na was otope dilution xchangeable Na in p was carried out on a normal Na ol or 3,400 mg per of exchangeable Na in dietary Na d out in the study lved taking t the end of a 7- hase (17 mmol or) and of a 7-day e (270 mmol or ay)	Investigation of 62 subjects on normal Na intake: Blood pressaure (BP) was higher in the group of normotenaive men with a family history of hypertension ($p < 0.005$), but age, urinary Na excretion, plasma renin activity, and aldosterone levels or creatine clearance were comparable Exchangeable Na did not differ significantly between the two groups and was unrelated to arterial pressaure or to plasma renin activity Investigation of subgroup of 23 subjects varying the Na intake: At the end of the low-Na phase, there was no significant difference in BP, heart rate, body weight, exchangeable Na, plasma Na and potassium, or creatinine clearance between subjects with and without a family history of hypertension The change from a low-Na diet to a high-Na diet resulted in significant and comparable rises in body weight and exchangeable Na in the two groups, comparable values for Na-dependsnt suppression of renin, angiotensin II, aldosterone, and plasma catecholamines, and no changes in heart rate, plasma Na and potassium, or creatine clearance Supine SBP and DBP increased with Na intake in all subjects but more in subjects with a family history of hypertenaion (SBP: from 119 to 126 mm Hg, DBP: from 76 to 80 mm Hg) as compared to those without a family history of hypertension (SBP: from 112 to 113 mm Hg, DBP: from 69 to 71 mm Hg)	Findings suggeat that exchangeable body Na is normal and adapts normally to variations in dietary Na intake in normotensive subjects with familial predisposaition to hypertension The authors concluded that exchangeable body Na depletion in early hypertension appeara to be a secondary rather than a primary event

TABLE--CONTIN

Study	Study Design	Subjects	Methods
Carney (1991) (Ref 136)	Randomized double-blind crossover study to evaluate the effect of additional sodium chloride (NaCl) compared with a placebo on BP control over a 6 week period before changing to the other trial arm for an additional 6 week period	11 patients with mild to moderate essential hypertension satisfactorily treated with diverse hypotensive agents (BP stable and well controlled for at least 6 months with no evidence of renal, cardiac, hepatic, or endocrine disease) (5 men, 6 women) Age range: 30 to 65 years	Patients were kept on diets and randomly as week periods of addit (100 mmol or 2,300 mg NaCl tablets per day) placebo with a subseq crossover Body weight, pulse, and erect BP (mean of readings) were measur 4, and 6 weeks of eac Blood collections and urine collections wer study commencement, and 12 weeks
Dustan (1988) (Ref. 125)	Intervention study to investigate the quantitative importance of Na balance to arterial pressure changes produced by changes in Na intake Conducted at the University of Alabama Hospital	Protocol 1: 51 normotensive white patients (19 males, 32 females) 18 normotensive black patients (7 males, 11 females) 21 hypertensive black patients (5 males, 16 females) Protocol 2: 11 normotensive white patients (2 males, 9 females) 16 normotensive black patients (6 males, 10 females) 19 hypertensive black patients (4 males, 15 females)	Protocol 1: A 3-day control peri or 3,400 mg Na intak followed by 4 days o depletion (SD) (low- meq or 210 mg Na per furosemide (1 mg/kg first day) followed salt loadingPABA (SL diet continued plus isotonic NaCl soluti meq or 90 mg per kg given intravenously Protocol 2: Same as except the sequence changes was reversed For both protocols, was calculated by su urinary Na excretion intake and expressed Kg, either positive

ONTINUED

thods	Results	Comments
pt on normal ly assigned to 6 additional Na 00 mg slow Na (10 day) or e ubsequent se, and supine an of two easured at 1, 2, f each trial arm s and 24-hour s were taken at nt, and 1, 6, 7,	Tablet compliance was excellent There were no significant changes in mean supine or erect BP with increased NaCl in patients on various hypotensive drugs	Findings suggest that excess dietary Na does not jeopardize BP control in patients on verious hypotensive drugs
period (150 meq intake per day) ays of salt (low-Na diet of 9 a per day) and g/kg given on the owed by 3 days of A (SL) (low-Na plus 25 mL/kg of olution or 3.08 r kg per day) usly e as Protocol 1 ence of Na intake ersed ols, Na balance by subtracting etion from Na essed in meq per tive or negative	Protocol 1: Mean arterial pressures of the two normotensive groups were comparable in the control period and varied little during SD and SL Mean arterial pressures of the hypertensive group fell during SD and returned toward control values during SL Na balance data were comparable for the three groups, except the hypertensives lost more Na during SD than the normotensives Protocol 2: Mean arterial pressures of the normotensive white group varied little during SD and SL Mean arterial pressures of both the normotensive and the hypertensive black groups fell during SD and rose during SL Na balance date were comparable for the two normotensive groups; the black hypertensives retained less Na during SL and did not lose more Na during SD than the normotensives Spearman correlation coefficients indicated that there was no significant relationship between arterial pressure changes and Na losses during SD or Na retention during SL in either protocol or any group	The authors noted that group averages obscured the haterogeneity of the BP responses Spearman correlations suggest that salt-sensitive (SS) hypertension results not from the magnitude of Na retention, but from the pressor mechanisms evoked

[Docket No. 90N–0361]

RIN 0905–AD08

Food Labeling; Declaration of Ingredients

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending its food labeling regulations to make ingredient labeling more useful for consumers. The agency is also responding to the Nutrition Labeling and Education Act of 1990 (the 1990 amendments), which amended the Federal Food, Drug, and Cosmetic Act (the act) by requiring the listing of the common or usual names of: (1) All ingredients in standardized foods and (2) all color additives required to be certified by FDA.

In addition, this document will: (1) Permit inclusion of the food source in the names of the sweeteners defined by the food standards in §§ 168.110 and 168.111 (21 CFR 168.110 and 168.111) (i.e., "corn sugar anhydrous" and "corn sugar monohydrate" would be permitted in addition to names already provided for in § 168.110(b) ("dextrose anhydrous" or "anhydrous dextrose") and § 168.111(c) ("dextrose monohydrate" or "dextrose")); (2) require the declaration of all protein hydrolysates (hydrolyzed vegetable protein and others), including the identification of the food source, e.g., "hydrolyzed corn protein," in the list of ingredients; (3) require identification of a caseinate (e.g., sodium caseinate) as a milk derivative when used in foods that claim to be nondairy foods; (4) provide a uniform format for voluntary declaration of percentage ingredient information; (5) require label declaration of sulfiting agents that have a functional effect in a standardized food or that are present in a standardized food at a detectable level of 10 parts per million (ppm) or more; and (6) provide certain exemptions from the requirements for listing the specific common or usual names of preservative coatings on fresh fruits and vegetables. Elsewhere in this issue of the **Federal Register**, the agency is publishing a final rule under the provisions of section 701(e) of the act (21 U.S.C. 371(e)) to establish and amend the ingredient labeling requirements within the standards of identity for dairy products (parts 131, 133, and 135 (21 CFR parts 131, 133, and 135)) and maple sirup (syrup) (§ 168.140 (21 CFR 168.140)). Also in this issue of the **Federal Register**, the agency is publishing a proposed rule to: (1) Amend the ingredient labeling requirements within the standard of identity for canned tuna (§ 101.190); (2) amend the common or usual name regulations for protein hydrolysates (§ 102.22) to require the term "contains glutamate" as a part of the common or usual name of autolyzed yeast extracts and certain hydrolyzed proteins; and (3) amend the food labeling regulations in § 101.22 (21 CFR 101.22) to allow "and/or" labeling for the declaration of sweeteners in soft drinks.

DATES: The effective date of the provisions in this final rule for ingredient listing of standardized foods and declaration of certified color additives is May 8, 1993 (§ 101.4(a) and (b)(2)(i), § 101.22(k), and parts 130 through 169). The effective date of all other provisions in this regulation is May 8, 1994. The Director of the Office of the Federal Register approves the incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51 of a certain publication at 21 CFR 130.9, effective May 8, 1993.

SUPPLEMENTARY INFORMATION:

I. Background

In the **Federal Register** of June 21, 1991 (56 FR 28592), FDA published a proposed rule (hereinafter referred to as the June 21, 1991, proposal) to implement amended sections of the act in accordance with section 7 of the 1990 amendments (Pub. L. 101–535) to require the listing of the common or usual names of all ingredients in standardized foods and of all color additives required to be certified by FDA under section 706(c) of the act (21 U.S.C. 376(c)) that were used in the food.

In response to written and oral comments received on an advance notice of proposed rulemaking (ANPRM) published in the **Federal Register** of August 8, 1989 (54 FR 32610), FDA also proposed in the June 21, 1991, proposal to: (1) Require that when more than one sweetener is used in a product, all sweeteners be listed together in the ingredient list under the collective term "sweeteners"; (2) permit inclusion of the food source in the names of the sweeteners defined by the food standards in §§ 168.110 and 168.111; (3) require the declaration of protein hydrolysates used for flavor-related purposes, including the identification of the food source in the list of ingredients; (4) require identification of caseinate as a milk derivative when used in a food that claims to be a nondairy food; (5) require that label statements explain that the list of ingredients is arranged in descending order of predominance; (6) provide a uniform format for voluntary declaration of percentage ingredient information; and (7) permit certain exemptions from requirements for listing the specific common or usual names of preservative coatings on fresh fruits and vegetables.

FDA also reproposed labeling requirements for sulfiting agents in standardized foods that it had first proposed in the **Federal Register** of December 19, 1988 (53 FR 51062). In 1988, FDA proposed to require that any sulfiting agent (or combination of sulfiting agents) that is present in a standardized food and is functional and provided for in the standard of identity, or that is present in the finished food at a detectable level of 10 ppm or more, must be declared on the label of the food by its common or usual name. Under the proposal, label declaration of sulfites meeting these criteria would be required regardless of whether the sulfite is directly added or indirectly added to the food via one or more of the ingredients of the food. The preamble to the December 19, 1988, proposal was incorporated in the June 21, 1991, proposal. In this final rule, FDA is responding to the comments received on the proposal and on the reproposal.

The agency received over 700 letters about the June 21, 1991, proposal. Each letter contained one or more comments. The letters were from a wide range of sources, including consumers, consumer organizations, professional associations, State and local government agencies, industry, and industry trade associations. Many comments generally supported the proposal or various provisions of the proposal. Other comments addressed issues outside the scope of the proposal (e.g., nutrition labeling, State petitions for exemption from preemption) and will not be discussed here. Many of the comments suggested modifications, revisions, or revocations of various provisions of the proposal. A summary of the comments, the agency's responses to the comments,

and a complete discussion of the agency's conclusions with respect to ingredient labeling, follow.

II. Ingredients of Standardized Foods

Before the 1990 amendments were enacted, FDA had authority under section 403(g) of the act (21 U.S.C. 343(g)) to require the declaration of optional ingredients in standardized foods. The act did not make any provision, however, for the declaration of mandatory ingredients (21 U.S.C. 343(g) and (i)). In the absence of statutory authority, FDA could not require the complete listing of all ingredients in standardized foods. However, the 1990 amendments revised section 403(i) of the act to treat standardized foods like all other foods and require the listing of all ingredients.

In addition, section 8 of the 1990 amendments removed most rulemakings on food standards from the coverage of section 701(e) of the act. Thus, they are subject to section 701(a) of the act. Actions for the amendment or repeal of food standards for dairy products and maple sirup, however, remain subject to section 701(e) of the act, which prescribes formal rulemaking procedures for the issuance, amendment, or repeal of regulations. Under formal rulemaking procedures, there is an opportunity to object to a final rule and to request a public hearing based upon such objection. Such an opportunity is not provided as part of the notice-and-comment rulemaking procedures followed by the agency under section 701(a) of the act. The agency is publishing the regulations set forth below under section 701(a) of the act. Elsewhere in this issue of the Federal Register, the agency is amending the standards of identity for dairy products in parts 131, 133, and 135 and for maple sirup in § 168.140 under the formal rulemaking provisions of section 701(e) of the act.

A. General Labeling of Standardized Foods

To make its ingredient labeling regulations consistent with the 1990 revision of section 403(i) of the act that pertains to standardized foods, FDA proposed in the June 21, 1991, proposal, to add new § 130.3(e) (21 CFR 130.3(e)). The proposed paragraph specified that all mandatory and optional ingredients of standardized foods must appear on food labels in accordance with the requirements of part 101 (21 CFR part 101), except that where a definition and standard of identity contains a specific provision with respect to the declaration of optional ingredients, the optional ingredients may be declared in accordance with that provision. FDA also proposed to amend all the standards of identity to require that all ingredients be declared on the label in accordance with the applicable sections of part 101 and part 130 (21 CFR part 130).

1. International Implications

1. Two comments from foreign governments opposed the declaration of mandatory ingredients of standardized foods. These comments maintained that listing mandatory ingredients would place an undue burden on the manufacturer without a noticeable advantage to the consumer and would cause confusion among foreign manufacturers, because in most other countries, manufacturers are required only to provide optional ingredient labeling in standardized foods. These comments argued that this regulation would require foreign companies to use separate labels just for the U.S. market, consequently increasing costs and discouraging free trade. They further maintained that consumer education would be more beneficial than ingredient declaration because standardized foods are prepared according to regulations.

The agency advises that foreign companies that market their products in the United States will have to comply with this requirement. The agency does not have the authority to provide a general exemption from this statutory provision for foreign manufacturers. The 1990 amendments amended section 403(i) of the act to require that the labeling of products marketed in the United States declare all ingredients used to make a food including a standardized food. Congress adopted this amendment with full recognition that it would eliminate a significant exception to the mandatory ingredient labeling requirements in section 403 of the act. See 136 Congressional Record H5842 (July 30, 1990). Consequently, FDA finds that there is no basis to make any changes in the regulations that it proposed in response to these comments.

2. Declaration of Noncharacterizing Optional Ingredients

2. Some comments, objecting to the proposed revocation of § 101.6, requested that provisions in § 101.6(d) be retained. This provision exempts manufacturers who declare all of the ingredients in a standardized food in the ingredient list from declaring certain optional ingredients on the principal display panel or wherever the name of the standardized food appears on the label, as required by certain individual standards. These comments asserted that without this provision, a 1"double declaration" of certain optional ingredients would be required which would overemphasize the optional ingredients, overcrowd the label, and may be confusing and misleading to the consumer.

These comments also responded to the question raised in the June 21, 1991, proposal on the need for the requirement in some standards of identity that certain optional ingredients be declared in conjunction with the name of the food wherever it appears on the label (e.g., the principal display panel), and that the declaration be so conspicuous as to be easily seen under customary conditions of purchase. The comments recommended that declaration of these ingredients in this manner be voluntary because all ingredients will now be required to be declared on the information panel.

The agency agrees with the comments. In most cases, the declaration of certain optional ingredients in conjunction with the name would be duplicative and unnecessary now that the 1990 amendments require that all ingredients of standardized foods be declared in the ingredient list. It is not the agency's intent to require dual declaration of noncharacterizing optional ingredients. However, the agency notes that in some instances, the optional ingredients provided for in the individual standards of identity are characterizing in the food. In such instances, the optional ingredient must be declared in accordance with the provisions of the specific standard, as required by § 101.3(f) and new § 130.11.

With regard to retaining § 101.6, the agency recognizes that, in the absence of § 101.6, several of the standards of identity (e.g., Macaroni products (21 CFR 139.110)) would require that all optional ingredients in the food, whether characterizing or not, be declared wherever the name of the standardized food appears on the label. The agency considers such dual declaration of noncharacterizing optional ingredients in standardized foods to be unnecessary and inappropriate. Nonetheless, the agency finds that it is not appropriate simply to retain § 101.6(d).

Section 101.6(d) includes guidance on the voluntary listing of ingredients in standardized foods. Such guidance is no longer necessary under the new ingredient listing requirements. The agency finds that rather than retaining § 101.6(d), it is more appropriate to establish general provisions regarding label declaration of optional ingredients

of standardized foods in part 130, where the other general regulations for food standards are set forth.

Accordingly, the agency is revoking § 101.6 and establishing new § 130.11 to prescribe requirements for the declaration of characterizing ingredients and an exemption from such requirements for noncharacterizing ingredients. The requirements in new § 130.11 are intended to provide manufacturers the same options regarding declaration of noncharacterizing ingredients of standardized foods that were provided by § 101.6(d). The basic difference between new § 130.11 and § 101.6(d) is that the requirements in the latter section were based on voluntary declaration of all ingredients in standardized foods, whereas new § 130.11 reflects the requirements that all ingredients in standardized foods must be declared, as provided in the 1990 amendments.

The agency finds that the adoption of new § 130.11 in this final rule is a logical outgrowth of the proposal. The proposed revocation of § 101.6 created ambiguity between the agency's position not to require dual declaration of certain optional ingredients and the requirements of some of the existing standards of identity. Thus, the agency is adopting new § 130.11 to remove this ambiguity.

3. Ingredients of Standardized Juices

3. One comment requested that the agency provide an exemption under § 101.100(a)(3)(ii)(b) for naturally occurring constituents or components of fruit juice from ingredient declaration requirements. The comment expressed the opinion that substances that are ingredients of standardized foods, and thus subject to the new ingredient listing requirements, should be differentiated from those that, in the comment's view, are naturally occurring constituents of the raw food from which the standardized food is made and that, therefore, should not be subject to these requirements. The comment maintained that the distinction between "ingredients" and "constituents" is clearly recognized by the act, and that the distinction is made clearer in § 101.100(a)(3)(ii)(b), which provides for an exemption from ingredient declaration for processing aids that are "substances that are added to a food during processing, are converted into constituents normally present in the food, and do not significantly increase the amount of the constituents naturally found in the food."

The comment noted that several of the standards of identity for various forms of orange juice and grapefruit juice in part 146 (21 CFR part 146) require that all "optional ingredients" be listed on the label in the statement of ingredients. The comment further stated that each of the standards that refers to "optional ingredients" uses the term to apply to added ingredients such as sweeteners or concentrated juice products. The comment also noted that these standards provide for the removal, addition, and adjustment of certain naturally occurring constituents or components of the juice, such as the oil, pulp, and essence.

FDA does not agree with this interpretation of § 101.100(a)(3)(ii)(b). The exemption from ingredient declaration provided by § 101.100(a)(3)(ii)(b) pertains to "incidental additives," substances that are present in a food at insignificant levels and that do not have any technical or functional effect in that food. Oil, pulp, and essence are not incidental additives under this definition for the following reasons:

First, fruit oils, pulp, and essence are added to fruit juice products to accomplish specific technical functions in the manufactured juice products and are, therefore, not processing aids. These constituents are added to the juice to replace constituents or components (oil, pulp, and essence) of the juice that are intentionally or unavoidably removed during processing. Their addition enables manufacturers to adjust the organoleptic characteristics of the juice as needed, because of natural variations in the fruit from which it is derived and to achieve uniform quality and organoleptic properties in the finished products from lot to lot and season to season (Ref. 44).

Secondly, the level of use of the added ingredients is not insignificant. For example, in the manufacture of frozen concentrated orange juice, most of the pulp of orange juice is removed to facilitate concentration. Pulp, obtained from oranges, is later added to the concentrate in amounts sufficient to yield levels in the finished product that are comparable to the pulp levels of the raw juice. Therefore, these ingredients cannot qualify as incidental additives or as processing aids under § 101.100(a)(3)(ii)(*b*).

However, FDA notes that when these naturally occurring constituents (oil, pulp, and essence) are removed from the juice for purposes of efficient processing, and these constituents, from the same types of fruit provided by the standard (including any limits on fruit species) are added to the juice later in the manufacturing process, there is no need to declare these constituents as "ingredients" under section 403(i)(2) of the act. The agency believes that this approach is reasonable because when the constituents of the juice are added to the juice, in the same proportions as in the original juice, the basic composition of the juice is not changed. Further, FDA believes that it may be misleading to consumers if these constituents are listed in the ingredient statement of the juice when their addition has not altered the basic composition of the juice. Consumers might be led to believe that the juice has been fabricated from the individual juice components, or that the juice contains substantially higher levels of these constituents than would be the case if the ingredients had not been added.

Thus, FDA advises that only if pulp, oil, or essence are added at levels significantly in excess of those found in the raw juice from which the juice is derived, or if they are obtained from an extraneous source, i.e., from sources other than the fruit from which the juice is obtained (e.g., produced synthetically or purchased through a flavor supplier for artificially adding flavor or texture to the juice), would they be ingredients subject to the ingredient labeling requirements for standardized foods, as set forth in part 130.

4. One comment expressed the opinion that orange juice from different species of orange should continue to be permitted to be declared as "orange juice" on the label. The comment noted that the standards of identity for pasteurized orange juice (§ 146.140), canned orange juice (§ 146.141), orange juice from concentrate (§ 146.145), and frozen concentrated orange juice (§ 146.146) provide that the finished juices are made from the juice of oranges of the species *Citrus sinensis*, with up to 10 percent of the juice from the species *C. reticulata* or hybrids thereof. Similarly, the comment noted, the standard of identity for grapefruit juice (§ 146.132) provides for juice from the species *C. paradisi Macfadyen*, with up to 10 percent of the juice coming from mature hybrids of grapefruit.

In this context, FDA notes that the standard for frozen concentrated orange juice (§ 146.146) also provides for the addition of up to 5 percent of the juice of mature oranges of the species *C. aurantium*. By cross-reference to this standard, the standards of identity for orange juice from concentrate (§ 146.145), reduced acid frozen concentrated orange juice (§ 146.148), concentrated orange juice for manufacturing (§ 146.151), and frozen concentrated orange juice with

preservative (§ 146.153) also provide for the juice of oranges of *C. aurantium*.

FDA agrees with the comment that juice from different species of orange (*C. sinensis*, *C. reticulata*, and *C. aurantium*) may be declared as a single food. The labeling regulations in part 101 (§ 101.4(a)) require that food ingredients be declared by their common or usual names. There is no requirement that the scientific species names be used on the food label.

In addition, FDA recognizes that the need to blend juices, as well as juice constituents, will vary depending on the quality of the oranges used and the desired characteristics of the finished juice product. For example, the juice of mandarin oranges (*C. reticulata*) or sour oranges (*C. aurantium*) may be blended with the juice of the sweet oranges (*C. sinensis*) to adjust the color or degree of sweetness to compensate for differences arising from seasonal variations or the lack of availability of specific varieties. Such variations in formulation of the processed orange juice products could require multiple labels for products with essentially the same composition and organoleptic properties. The agency believes that in such cases, requiring multiple labels for the same juice product is impractical and needlessly burdensome. FDA, therefore, is not requiring that the specific orange species or varietal names be listed in the ingredients statement of orange juice products when manufacturers comply with the limits on the species of orange specified in the standards of identity in part 146. FDA takes the same position for standardized grapefruit juice products.

4. Addition of Water to Tomato Concentrates

5. One comment opposed the current exemption in § 155.191(a)(3)(iv) (21 CFR 155.191(a)(3)(iv)) for label declaration of water added to adjust the tomato soluble solids content of tomato concentrates within the range of soluble solids levels permitted for these foods. The comment stated that some manufacturers make tomato concentrate with an approximate Brix value of 31° and, at a later date and typically in a geographically different location, add 2.5 to 3.5 parts water to 1 part tomato concentrate to make a tomato product with a significantly lower Brix value. Thus, the comment asserted that water added to tomato concentrates is an ingredient and should be required to be declared in the ingredient statement.

The intent of this exemption was to allow for the adjustment, within the range of concentrations for the particular finished tomato product being made, of the soluble solids content of the tomato concentrate products during the production of these tomato products from fresh tomatoes. For example, if the product being manufactured is tomato puree, and the resulting tomato concentrate has a soluble solids content in the range provided by the standard of identity for tomato puree, i.e., not less than 8 percent but less than 24 percent, manufacturers would be allowed to add water to the puree to adjust the tomato soluble solids content within the standardized range and not have to declare the added water. Similarly, manufacturers of tomato paste would be allowed to add water to a tomato concentrate containing more than 24 percent soluble solids without having to list the added water as an ingredient, as long as the finished tomato paste contained at least 24 percent soluble solids as required by the standard.

FDA provided the labeling exemption codified in § 155.191(a)(3)(iv) in response to an industry comment (49 FR 15071, April 17, 1984). The exemption was intended to eliminate confusion as to whether, for example, a manufacturer of a tomato puree of 12.0 percent soluble solids that is prepared from a tomato puree of 18 percent soluble solids would have to state "tomato concentrate and water" in the ingredients statement.

Differences in raw ingredients and difficulty in obtaining a precise endpoint during the evaporation process in manufacturing tomato concentrates justify addition of the water to adjust the soluble solids level. The addition of water enables manufacturers to obtain a uniform product concentration from batch to batch and facilitates production of products that are designed to meet specific needs and that fall within the ranges provided by the standard. Therefore, FDA has not deleted the current exemption in § 155.191(a)(3)(iv).

However, when tomato paste is converted to tomato puree, by the addition of water, the label of the puree, and of any food in which that puree is used, must show the ingredients used, namely, tomato paste and water (Refs. 45 and 46). This result is required by section 403(i)(2) of the act, which states that when a food is fabricated from two or more ingredients each such ingredient must be declared by its common or usual name, except that spices, flavorings, and color not required to be certified under section 706(c) of the act may be declared as such without naming each. In addition, it would be false and misleading to make a food (tomato puree) from two ingredients (water and tomato paste) and not disclose that fact on the label. It is true that both tomato paste and tomato puree are provided for in the general standard for tomato concentrates (§ 155.191). However, this fact does not mean that a manufacturer can transform one food with an established common or usual name into another without disclosing that fact on the label.

With regard to labeling standardized and nonstandardized tomato products made by diluting previously processed tomato concentrates with 2.5 to 3.5 parts of water, one comment contended that consumers and purchasers of these tomato products need a label statement on the principal display panel to disclose when that tomato product has been "made from concentrate" because consumers do not take time to read ingredient statements. The agency has also received several letters in support and in opposition to the position stated in this comment.

The intent of this rulemaking is to deal with ingredient issues, not how reconstituted products should be labeled. This issue was not raised in the proposal, nor can it be viewed as the logical outgrowth of any issues that were. Therefore, these comments are outside the scope of this rulemaking.

5. Optional Ingredients of Canned Tuna

6. One comment suggested that the optional ingredients listed in the standard of identity for canned tuna in § 161.190(a)(6) (21 CFR 161.190(a)(6)) need only be declared in the ingredient statement. The comment asserted that these optional ingredients are "minor" and "noncharacterizing." Therefore, the comment continued, the agency should not require that they be declared wherever the name of the standardized food appears on the label.

FDA disagrees that all of the optional ingredients listed in § 161.190(a)(6) are noncharacterizing in canned tuna. In many instances the optional ingredients, provided for in this paragraph on how the food may be flavored and seasoned, will in fact, be characterizing, depending upon the level and specific conditions of use of the ingredient in the food.

For example, added to canned tuna at low levels, lemon flavoring, one of the optional ingredients provided for in § 161.190(a)(6), would not impart any characteristic flavor of its own but would merely subtly alter the flavor profile of canned tuna. However, above a certain level, this ingredient would contribute a distinctive lemon flavor to the canned tuna.

In the former case, the agency requires that the optional ingredient be declared only in the ingredient statement as "natural flavor." Such ingredients need

not be declared in conjunction with the name of the standardized food on the label because they are not significant characterizing ingredients in the food (see § 130.11).

In the latter situation, because "lemon flavoring" would be a significant characterizing ingredient, it would need to be declared on the food label, in accordance with the provisions of § 101.3 and § 102.5(c) (21 CFR 102.5(c)), as a characterizing ingredient to distinguish lemon-flavored canned tuna from other types of canned tuna. Therefore, in this instance, in addition to the declaration of "flavoring" in the ingredient statement on the food label, the words "lemon flavored" or "with lemon flavoring" would need to appear in conjunction with the name of the standardized food as required by new § 130.11 and by new § 161.190(a)(8)(vi) and (a)(8)(viii).

When FDA proposed the revocation of § 101.6 in the June 21, 1991, proposal, the agency did not intend to alter its policy concerning the naming of canned tuna on the food label. As previously discussed, FDA is revoking § 101.6 and establishing new § 130.11 as a replacement for § 101.6(d). The latter action will correct the unanticipated effects that the revocation of § 101.6 would have had on the naming of canned tuna and other standardized foods. In accordance with new § 130.11, an optional ingredient listed in the standard of identity for canned tuna will have to be declared wherever the name of the food appears on the label only if the use of the optional ingredient in the food significantly distinguishes the food from the same standardized food that does not contain the optional ingredient as a significant characterizing ingredient.

7. One comment stated that vegetable broth used in canned tuna is a flavoring and falls under the definition of flavoring ingredients in § 101.22.

In claiming that vegetable broth is a flavoring, this comment is pointing to the fact that vegetable broth contains vegetable extractives that may provide flavor to the canned tuna. However, this effect may be outweighed by the flavor-enhancing effect that this ingredient may have in canned tuna. Flavor enhancers are used to supplement, enhance, or modify the original taste or aroma of a food without imparting a characteristic taste or aroma of their own (§ 170.3(o)(11) (21 CFR 170.3(o)(11)), while flavoring agents and adjuvants impart or help impart a taste or aroma in food (§ 170.3(o)(12)).

According to information available to FDA, vegetable broth used in canned tuna may serve to enhance the basic flavor of the tuna and to make it appear less bland when it is packed in water, as in dietetic packs where it supplements the flavor of the product, without imparting a flavor of its own (Refs. 47, 48, and 49). It also aids in suppressing the bitter flavors that may develop during the canning operation (Ref. 47). Because vegetable broth is not generally used at levels at which it would impart a characteristic flavor or aroma of its own to the tuna, FDA concludes that flavor-enhancement may be a significant function of vegetable broth in canned tuna.

Flavor enhancers are not exempt from the ingredient declaration requirement in section 403 of the act. Therefore, they must be listed by their common or usual names in the ingredient statement on the food label. Where vegetable broth functions to enhance the basic flavor of the tuna, it must be declared by its common or usual name in the ingredient statement of the food label, even though it may, at certain levels of use and depending on the flavoring potential of vegetable sources used in making the broth, also act as a flavoring in the food.

Where the effect of the addition of vegetable broth is such that it adds a characterizing flavor to the tuna, the standard of identity, in new § 161.190(a)(8)(vi) and (a)(8)(viii), requires that the term "seasoned with vegetable broth" appear in close proximity to the name of the standardized food wherever that name occurs on the principal display panel of the label. In this situation, the vegetable broth would be properly declared in the ingredient statement as "flavoring" provided that it does not serve a flavor enhancing function in the food. Where the vegetable broth serves both as a flavor enhancer and a flavor, it must be declared by it common or usual name in the ingredient statement, as well as in conjunction with the name of the food when it serves as a characterizing ingredient, in accordance with new § 161.190(a)(8)(vi) and (a)(8)(viii).

8. One comment stated that, traditionally, the individual vegetable extractives used in the preparation of vegetable broth have not been declared on the label of canned tuna. This comment interpreted the agency's implementation of the 1990 amendments to mean that FDA will require the listing of each vegetable that is in the vegetable broth in order of predominance parenthetically following the term "vegetable broth" in the ingredient statement on the label of canned tuna. The comment stated its opposition to this approach. In support of its position, the comment pointed out that this method of listing the ingredients comprising vegetable broth in canned tuna would "intensify label crowding" and "create confusion as to whether or not whole pieces of vegetables are contained therein." This comment also stated that if FDA requires the listing of the components of vegetable broth in canned tuna, then the agency should generate an alternative labeling scheme that would be flexible, economically feasible, and protective of trade secrets.

FDA agrees that the listing of each ingredient comprising vegetable broth on the label of canned tuna could be lengthy and cumbersome. New § 130.3(e) provides that:

> All ingredients must be listed in accordance with the requirements of part 101 of this chapter, except that where a definition and standard of identity has specific labeling provisions for optional ingredients, optional ingredients may be declared in accordance with those provisions.

The standard of identity for canned tuna permits the optional ingredient defined in renumbered new § 161.190(a)(6)(v) to be called "vegetable broth" on the label of canned tuna, as specified in new § 161.190(a)(8)(vi). Hence, the optional ingredient vegetable broth may be listed as "vegetable broth" in the list of ingredients on the label of canned tuna. The new regulations do not require full declaration of all of the ingredients of which the vegetable broth is comprised.

However, for reasons discussed in another document that appears elsewhere in this issue of the **Federal Register**, the agency is proposing to amend the standard of identity for canned tuna to require the declaration of soybeans when the ingredient vegetable broth contains soybean extractives. If the agency adopts this proposal, the ingredient will have to be listed as "vegetable broth (includes soybeans)."

9. Although the agency did not receive any other comments with respect to canned tuna, FDA, as set forth in new § 161.190(a)(6)(ii), is amending the standard of identity for this food to eliminate the term "purified" in conjunction with "monosodium glutamate" (MSG) for consistency with the terminology for MSG in the food additive regulation in 21 CFR 182.1 and in the food labeling regulation in § 101.22(h)(5). The term "purified" had been used in the name in § 101.35 to distinguish between three types of ingredients, "monosodium glutamate," "hydrolyzed proteins," and "hydrolyzed proteins with reduced monosodium glutamate content." Elsewhere in this document (See section VIII. of this document), FDA is revoking

§ 101.35 because the regulation is obsolete and does not include many of the protein hydrolysates used in foods.

In addition, consistent with the establishment of new § 102.22, as set forth below, to provide for the declaration of protein hydrolysates by a common or usual name that is specific to the ingredient and that identifies the food source from which the protein was derived, the agency is amending the standard of identity in new § 161.190(a)(6)(iii) to require labeling of the source of protein in the optional ingredient "hydrolyzed protein."

Furthermore, to reflect the agency's decision to revoke § 101.35, the agency is amending the standard of identity for canned tuna in new § 161.190(a)(6) to remove "hydrolyzed protein with reduced monosodium glutamate content" from the list of optional ingredients permitted in canned tuna. As discussed in the June 21, 1991, proposal (56 FR 28592 at 28600 et seq.), all hydrolyzed protein contains MSG, and this MSG is not itself an ingredient that is subject to the ingredient declaration requirements of the act. In that document, FDA stated that after carefully considering the information available concerning the safe use of protein hydrolysates and whether the presence of MSG is a material fact that needs to be disclosed on the label for health reasons, it tentatively concluded that the information does not provide an appropriate basis to require declaration of MSG as a component of protein hydrolysates. However, for the reasons discussed in another document elsewhere in this issue of the **Federal Register**, the agency has reconsidered this issue and is proposing to require the declaration of glutamate as part of the common or usual name when a component of certain hydrolyzed proteins. Therefore, it will no longer be necessary to distinguish between "hydrolyzed protein" and "hydrolyzed protein with reduced monosodium glutamate content" in the manner currently provided for in this standard.

Accordingly, new § 161.190(a)(6)(i) through (a)(6)(ix) have been renumbered to reflect the elimination of "hydrolyzed protein with reduced monosodium glutamate content" from the list of optional ingredients permitted in canned tuna. "Hydrolyzed protein" will be retained in the list of optional ingredients, as specified in § 161.190(a)(6) below (see section VIII. of this document).

6. Other Related Actions

10. The agency did not receive any comments that objected to its proposal to require that the ingredient declaration for fruit butter in § 150.110 conform to the regulations in part 101. Thus, the agency is removing § 150.110(e)(2)(ii) (21 CFR 150.110(e)(2)(ii)), which states that if sugar or invert sugar is the sweetener used, the term "sugar" may be used, and if the sweetener used is derived from corn, the term "corn sweetener" may be used. The agency is also requiring that the ingredient declaration for fruit butter conform to the regulations in part 101. In this rule, the agency is terminating the rulemaking to permit the use of the terms "sugar" and "corn syrup" as collective ingredient designations. The agency has determined that declaration of specific names for sweeteners within these collective categories is practicable. Consistent with this action, the agency has concluded that declaration of the specific names of sweeteners is also practicable for standardized foods and is deleting the requirements of § 150.110(e)(2)(ii).

The agency is also deleting the requirements in the standards for mixed nuts and peanut butter in §§ 164.110 and 164.150 (21 CFR 164.110 and 164.150) that provide for the use of the term "hydrogenated vegetable oil" or "vegetable oil" with the optional use of the name of the vegetable source, and the requirement in § 164.110 for label declaration of chemical preservatives. Required label declarations for these types of ingredients are clearly delineated in §§ 101.4(b)(14) and 101.22(j), respectively. Moreover, the "and/or" labeling exemption in § 101.4(b)(14) should effectively eliminate the need for collective names for vegetable oils on these standardized foods.

The agency did not receive any other comments with respect to proposed changes to specific standards of identity. Thus, the agency is finalizing the amendments to the individual standards as proposed.

In the July 21, 1991, proposal on Declaration of Ingredients, FDA withdrew the proposed amendment to § 101.4 (formerly § 1.10) pertaining to the establishment of the terms "sugar" and "corn syrup" as collective ingredient designations that was published in the **Federal Register** of June 14, 1974 (39 FR 20888); terminated the rulemaking proceeding initiated by that proposal; and denied the petitions commenting on that proposal from the Canada Dry Corp. (June 27, 1975—Docket No. 75P–0144), the Canners League of California (January 19, 1977—Docket No. 77P–0051), the Independent Bakers Association (September 22, 1977—Docket No. 77P–0357), the California Milling Corp. (June 19, 1978—Docket No. 77P–0051 CP0002), the Orth Co. (July 31, 1978—Docket No. 77P–0357), and L. Karp & Sons, Inc. (August 11, 1978—Docket No. 77P–0357 CP0003).

B. Labeling of Sulfites in Standardized Foods

In the **Federal Register** of December 19, 1988 (53 FR 51062), FDA published a proposed rule to require that any standardized food that contains a sulfiting agent that has a functional effect or that is present at a level of 10 ppm or more is misbranded if the presence of the sulfiting agent is not declared on the label by its common or usual name. The agency proposed to codify this requirement in new § 130.9. The agency also solicited comments regarding sulfite-sensitive consumers' ability to recognize and avoid foods labeled with the six common or usual names for sulfites (sulfur dioxide, sodium sulfite, sodium and potassium bisulfite, and sodium and potassium metabisulfite). In addition, the agency requested comments on whether any final rule should contain a requirement that the common or usual name of a labeled sulfiting agent should be followed by the term "sulfiting agent." The comments received on these and other aspects of this part of the proposal, and the agency's response, follow.

11. The majority of comments from consumers and industry supported adoption of § 130.9. These comments stated that sulfite labeling of standardized foods would decrease allergic type reactions by increasing consumer awareness, while allowing the vast majority of consumers, who are not sensitive to sulfites, to continue to consume foods containing sulfiting agents. A few consumers' comments, however, requested that all unnecessary uses of sulfites be banned, or, in the alternative, that principal display panel warnings be required. Citing the large number of people adversely affected by sulfites, the comments asserted that there was no established safe threshold for sulfites, and that they are one of the few food ingredients known to cause anaphylactic shock and death.

The agency recognizes that sulfites present a significant health problem for a small segment of the population, particularly some asthmatics. However, sulfiting agents do not appear to present a problem for most people, and the declaration of sulfiting agents in the list of ingredients will provide sufficient information for those people who need or want to avoid unexpected exposure to these ingredients. Thus, FDA does not believe that it is necessary to require

a warning stetement on food lebels or to ban ell uses of sulfites. In addition, the comments did not provide any data to support banning current uses of sulfites.

The egency believes thet the ection that it is taking in this final rule will efford more effective protection for sulfite-sensitive individuals then is currently provided. This provision for lebel declaration of sulfites for standardized foods is consistent with the provisions for label declaration of sulfites for nonstenderdized foods in § 101.100(a).

Thus, FDA is edopting new § 130.9, es proposed, in this final rule. As a result, all foods containing sulfiting egents thet are functionelly ective or present et 10 ppm or more in the finished food are now required to declare the presence of the sulfiting agent in the ingredient statement.

12. Some comments expressed the opinion thet the term "sulfiting agent" should be used instead of the common or usuel neme of the perticuler substance because it is more recognizable by consumers. None of these comments, however, offered any data to show the extent of consumer knowledge ebout the common or usuel names for sulfiting egents.

Lacking date, and reflective of the small number of comments from consumers on this issue, FDA is not persueded that requiring e descriptive or collective term to be used with the common or usuel name of the sulfiting egent is necessary because the declaration of the sulfiting egent by its common or usuel neme will edequetely inform the consumer of its presence.

Furthermore, sulfite sensitive consumers know to look for sulfiting egents in the ingredient stetement. However, the agency will not object if manufacturers choose to meke this dual declaration.

Moreover, the agency is not persuaded thet the term "sulfiting egent" should be used in plece of the common or usual neme for sulfiting agents added directly to the standardized food or for sulfiting agents that have a technical or functionel effect. FDA eddressed this issue with respect to label declaretion of sulfites in nonstandardized foods in the **Federal Register** of July 9, 1986 (51 FR 25012). At thet time the agency adopted § 101.100(a)(4) which requires sulfiting egents present et 10 ppm or more in a nonstandardized food be declared on the label. Furthermore, sulfiting agents that are directly added to, or that have a technical or functional effect in, food should be declared by the name of the specific sulfiting egent. However, the egency also established the policy that sulfiting egents thet are indirectly added to a food, and that have no technical or functional effect in the food, could be declared by a collective term. FDA considered the term "sulfiting agent" to be the most accurate and informetive collective term. The agency still believes thet this position is eppropriate for nonstandardized foods and is elso eppropriete for standardized foods. Thus, when indirectly edded sulfiting egents remain in a standerdized food in a significant emount, but no longer have a technical or functional effect, they may be declared by the term "sulfiting egents."

FDA also continues to hold that if a food contains a sulfiting agent that has a technical or functionel effect in the standardized food and that is declared in the list of ingredients by its common or usual name, es required by § 130.9(a), any nonfunctionel sulfiting egents present in the stenderdized food need not be declared separetely in the list of ingredients. In such circumstances, sulfite sensitive individuals will be elerted to evoid the food by the declaration of the former sulfiting agent. However, FDA emphasizes that this flexibility epplies only if the sulfite does not perform a technical or functionel effect in the standardized food.

13. Several comments from industry and trede associetions objected, for various reasons, to the use of the Monier-Williams method of sulfite anelysis. These comments requested thet firms should have the freedom to choose between "stete-of-the-art" methods and the Monier-Williams method in determining the amount of sulfite present.

FDA has selected the Monier-Williems method as the method thet it will use for enforcement of the sulfite labeling requirements because this method is an officiel method of the Associetion of Officiel Analytical Chemists end is the stendard egeinst which the accuracy of new procedures hes been judged. Moreover, this method will measure the free sulfite plus e reproducible portion of the bound sulfites in the food. However, the agency edvises thet processors and food manufacturers ere under no obligetion to use the Monier-Williams method for quelity control or any other purpose. Processors are free to, end frequently do, determine the correletion between the official FDA-designeted enforcement method, i.e., the Monier-Williems method, and their method of choice. They may then use their method of choice as they see fit, recognizing that FDA will rely on the Monier-Williams method in eny enforcement ection.

14. A few comments suggested that the concentration of the sulfite should be declared on the label, thereby ellowing the consumer to decide whether to purchese the product based on this informetion. The comments steted that this would absolve the manufecturers of liability, as long as the product did not exceed the limit.

The egency rejects this suggestion. Although the agency is eware that limited studies have been performed on sulfite-sensitive individuals to determine dose response reactions, the egency finds thet the availeble evidence does not establish thet a threshold level exists for sulfite-sensitive individuels. Furthermore, the agency does not believe thet sulfite-sensitive individuals should be expected to determine their tolerence levels. Therefore, FDA finds that, given currently evaileble informetion, there is no reason to require manufecturers to declare the concentration of sulfites on the lebel. Declaration of the sulfiting egent in the ingredient list will edequetely inform all individuels who are sensitive to sulfites thet sulfites ere present in the food.

15. One comment esked for clarification of the "written egreement" exception to the lebeling requirement es it applies to bulk shipment of ingredients thet will be further processed into consumer products by other manufacturers. The comment stated that it is impractical for ingredient menufacturers of sulfiting egents to enter into written bilateral contracts with each customer. The comment proposed an alternetive such as a "pure food" guarantee, indicating thet the food is not adulterated or misbranded within the meaning of the act (e.g., e letter of guarantee from the manufacturer that the product contains less then the maximum residuel limit of sulfites thet is consistent with the generally recognized as safe (GRAS) regulations or the inclusion of informetion on an invoice thet specifies the maximum residual level of sulfites contained in the product).

Section 101.100(d) provides an exemption from the labeling requirements for foods shipped in bulk when there is a written agreement between the shipper and the consignee. The written agreement must, emong other things, contain specifications for the processing, labeling, or repacking of the food by e designated establishment thet will ensure thet the food will not be adulterated or misbranded within the meaning of the act. The exemption provided in § 101.100(d) applies to all foods shipped under the prescribed provisions without full labeling and not just those foods containing sulfites.

Furthermore, § 101.100(d) is not a subject of this rulemaking. In addition, sulfite manufacturers have not provided reasons to persuade the agency that they should be treated differently from manufacturers of other ingredients. The alternative proposed in the comment is welcome additional information but is not a substitute for written agreements for interstate shipment of partially labeled food for further processing.

III. Label Declaration—Statement that Ingredients are Listed in Descending Order of Predominance by Weight

FDA proposed in the June 21, 1991, proposal to adopt proposed § 101.4(a)(3) to require that food labels bear a statement explaining that the list of ingredients is in descending order of predominance by weight. The proposed requirement was in response to comments received on the 1989 ANPRM that suggested that consumers were not aware of the requirement in new § 101.4(a)(1) that ingredients be declared in descending order of predominance by weight. FDA cited, as an example of an appropriate statement: "Ingredients (in descending order of predominance by weight): ————————, ————————, and ————————."

16. Although a few industry and consumer comments on the June 21, 1991, proposal supported proposed § 101.4(a)(3), the majority of industry comments requested that it be deleted from a final rule. Industry comments maintained that consumers have been made aware that ingredients are declared in descending order of predominance by weight through the food industry's advertisements. According to these comments, such advertisements highlight ingredient statements when comparing the quantity of various ingredients among competitive products. The comments said that, therefore, an explanatory statement would be demeaning to many consumers. These comments further argued that the proposed model statement, "Ingredients (in descending order of predominance by weight)," uses sophisticated terminology unlikely to be understood by those consumers who remain unaware of the listing requirement. These comments suggested that this issue could be more appropriately addressed through public education efforts by FDA and the food industry.

Other opposing comments on this issue emphasized that the labeling exemption in proposed § 101.4(a)(2) for ingredients that are present in amounts of 2 percent or less by weight allows listing the ingredients without regard to order of predominance. These comments maintained that the proposed statement would contradict the 2 percent rule and lead to consumer confusion.

Some comments further stated that the parenthetical statement, as proposed, would use valuable label space, especially on small packages, and would add to label clutter without significant benefit to the consumer. Of particular concern was ingredient labeling for chewing gum packages. Comments from the chewing gum industry stated that the addition of this statement on the ingredient label in conjunction with all of the other labeling changes required by the 1990 amendments and proposed by FDA could require the development of new packaging.

Comments from foreign governments stated that there was no requirement to include such a statement in their countries. They contended that if FDA established the requirement for such a statement, additional labeling difficulties and costs would be borne by both United States and foreign food manufacturers wishing to use a single label for both markets. These comments stressed that any additional costs would ultimately be passed on to consumers.

The agency has carefully considered all of the comments and has been persuaded to reconsider its position. The agency agrees that in some cases, educational efforts by the industry and FDA may better inform the public that ingredients are listed in descending order of predominance by weight than requiring the statement on the label. The agency also recognizes that with the implementation of other labeling requirements mandated by the 1990 amendments, label space, especially on smaller packages, may be limited. Finally, comments from consumers demonstrated little support for the proposal. Accordingly, the agency is not requiring that food labels bear a statement explaining that the list of ingredients is in descending order of predominance by weight and is deleting proposed § 101.4(a)(3) from this final rule. However, the agency encourages manufacturers to provide this information voluntarily when practicable.

IV. Declaration of Sweeteners in the Ingredient List

A. General

The June 21, 1991, proposal discussed several issues regarding labeling of sweeteners. Consumers had complained of not being able to determine the relative amounts of added sweeteners because sweeteners are listed at various positions throughout the ingredient list. In response, the agency proposed that all sweeteners be grouped together parenthetically following the term "sweeteners" when more than one sweetener is present in a product and be declared in the ingredient list in the order of predominance appropriate for the sum of all sweeteners in the product. The agency also withdrew a previous proposal, published in the **Federal Register** of June 14, 1974 (39 FR 20888), to establish the term "sugar" as a collective ingredient designation for sucrose and invert sugar and "corn sweeteners" as a collective ingredient designation for sweeteners derived from corn. With this action, the agency denied several industry petitions requesting the use of these collective terms.

17. One consumer comment strongly disagreed with allowing the ingredient sucrose to be labeled as "sugar" while other caloric sweeteners are labeled by their proper names. This comment also expressed the belief that manufacturers mislead consumers by using the term "No sugar added" when the product is sweetened by a caloric sweetener other than sucrose. The comment urged that all sweeteners be labeled by their proper names, and that the term "sugar" be prohibited.

FDA has traditionally held that the term "sugar" in an ingredient list refers to sucrose as defined in § 184.1854 (21 CFR 184.1854). Although the agency proposed in 1974 to permit the term "sugar" to also include invert sugar, the agency never acted on that proposal and subsequently withdrew it in the June 21, 1991, proposal. In addition, the agency believes that sucrose is the only sweetener that has traditionally been referred to as "sugar" by industry and consumers, and that the use of this term in the ingredient list is not misleading. Thus, the agency is not granting the request to prohibit the use of the term "sugar" as defined in § 184.1854. To promote greater consumer awareness of § 184.1854, FDA has specifically referenced it in new § 101.4(b)(20) (§ 101.4(b)(22) in the proposed rule).

With regard to the statement "no sugar added" when sweeteners other than sucrose are used in a food, the agency's position (21 CFR 105.66) has been that label declaration claims such as "no sugar added" may reasonably be expected to convey to consumers that the food contains no added nutritive sweeteners, such as high fructose corn syrup, malt syrup, or honey. Claims such as "no sugar added" refer not only to sucrose but to a class of sweeteners of which sucrose is just one. The agency addressed this issue in detail in its

proposal on nutrient content claims (56 FR 60421 at 60437, November 27, 1991). At that time, FDA proposed that claims for the absence of added sugars apply only to those foods to which sugar or other nutritive sweeteners have not been added directly or indirectly during processing or packaging. This issue is further addressed in the nutrient content claims final rule published elsewhere in this issue of the **Federal Register**.

18. Comments from consumers, consumer groups, and some State governments supported the agency's proposal that all sweeteners be listed together in the ingredient list under the collective term "sweeteners." They expressed the belief that current regulations permit manufacturers to hide the actual amount of added sweeteners in a product by dispersing them in the ingredient statement. In addition, several of these comments requested more complete information on the total amount of sugars present in a finished food and suggested that such information be required in nutrition labeling.

However, comments from industry opposed grouping sweeteners in the ingredient list. The comments questioned FDA's authority to require grouping sweeteners in the ingredient list and stated that there was no scientific or public health rationale for singling out sweeteners for distinctive treatment in the ingredient list. These comments argued that total sugars declaration is the function of the nutrition label and not the ingredient label. They further argued that sweeteners may be added to foods for other than sweetening purposes (e.g., as bulking agents, firming agents, cryoprotectants, and fermenting agents), and that grouping sweeteners in the ingredient list could obscure the intended function of the sweetener in the food, thereby generating consumer confusion. In addition, several comments raised concerns regarding labeling requirements of foods that: (1) Are themselves sweeteners, (2) contain a standardized multicomponent ingredient that had a sweetener as one of its ingredients, and (3) contained sweeteners that perform functions for which "and/or" labeling is permitted under current regulations (§ 101.4(b)(19)).

One comment from industry argued that inclusion of the term "sweeteners" in the ingredient list of food products that are themselves sweeteners is unnecessary. The comment asserted that a sweetener with two ingredients, both of which are "sweeteners," would have to list under this regulation "Ingredients: Sweeteners (dextrose, aspartame)," rather than a simpler and more straightforward listing of "Ingredients: dextrose, aspartame." This comment requested an exemption for products that are themselves sweeteners.

Other industry comments maintained that where manufacturers declare a multicomponent ingredient (e.g., a standardized or nonstandardized food for which there is a common or usual name and that is fabricated from two or more ingredients) of a food by its common or usual name followed by a parenthetical listing of the two or more ingredients in the multicomponent ingredient, sweeteners would either: (1) Have to be listed twice, first in the parenthetical list following the name of the multicomponent ingredient and second in the list of combined sweeteners contained in the finished food; or (2) have to be removed from the parenthetical list of the multicomponent ingredient and added to the parenthetical list of sweeteners. These comments contended that such a practice would be misleading because it would, in the first case, over-represent the amount of the sweetener by declaring it twice, or, in the second case, give the impression that the multicomponent ingredient is "sugar free."

The comments stated that, in the alternative, the parenthetical listing of the ingredients of the multicomponent ingredient, as provided in proposed § 101.4(b)(2)(i), would no longer be an option. Sweeteners would have to be removed from the multicomponent ingredient declaration and grouped with other sweeteners. The other ingredients in the multicomponent ingredient would then have to be dispersed in the ingredient list in descending order of predominance, as provided in proposed § 101.4(b)(2)(ii), without naming the multicomponent ingredient. As a result, common, readily identifiable multicomponent ingredient names such as "milk chocolate" or "marshmallows" would not appear in the ingredients statement, and the consumer would be misled.

Several other industry comments requested clarification regarding label declaration of sweeteners, such as sugar alcohols, that may be used as firming agents and that are currently declared parenthetically using "and/or" labeling following the collective term "firming agents." These comments asserted that manufacturers who may not adhere to a constant pattern of use of a particular firming agent that is a sweetener would be at a competitive disadvantage because of the additional expense of maintaining label inventories for every possible formulation.

Additional comments that opposed the grouping of sweeteners stated that consumers will avoid foods unnecessarily if the grouped sweeteners appear first or second in the ingredient list and thereby imply that such foods are "bad." These comments further stated that when low calorie or intense sweeteners are used, they would most likely be the only sweetening ingredient in a food and therefore would be exempt from this requirement because the group declaration of sweeteners is only triggered when more than one added sweetener is present. These comments asserted that consumers would be given the impression that a food containing an intense or low calorie sweetener contained less sugar and therefore, was more nutritious than a food that contained, for example, five sweeteners. In fact, the comment continued, the food containing five sweeteners may contain other essential nutrients not present in the food with the intense sweetener. Another comment asserted that the grouping of sweeteners in the ingredient list would lead to deceptive and unfair practices because manufacturers may manipulate formulations so that ingredients that are valued by consumers, such as honey and concentrated fruit juice, would appear to be more predominant when grouped with other sweeteners than they would under current labeling regulations.

Finally, two comments from foreign manufacturers that opposed grouping sweeteners in the ingredient list maintained that such a requirement would be a barrier for foreign trade because foreign manufacturers are not required to group sweeteners on labels. These comments further stated that foreign manufacturers would be required to use separate labels just for the U.S. market, consequently increasing costs and discouraging free trade.

The agency has carefully reviewed all of the comments and, as stated above, has been persuaded to reconsider its proposal to require grouping of sweeteners in the ingredient statement. As stated in the final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**, in response to section 403(q) of the act, FDA is requiring the declaration of total sugars in the nutrition label. The agency believes that information on the quantity of sugars in a finished food is more effectively conveyed as part of nutrition labeling, than ingredient labeling. The total amount of sugars, including both added and indigenous

sugars, is declared in the nutrition label, whereas the information on sugars content provided through ingredient labeling includes only added sweetening ingredients in order of predominance by weight. The ingredient label does not give information regarding the amounts of those sugars.

It is true that in the June 21, 1991, proposal, the agency stated that even if it were to require the declaration of total sugars, there was still a significant need for grouping sweeteners in the ingredient list to prevent consumers from being misled by the practice of dispersing sweetener names throughout the ingredient list. FDA has reconsidered this position, however, and concludes that from a nutritional standpoint, the placement of added sugars in the ingredient statement is not relevant.

For FDA to require the grouping of sweeteners in the ingredient list, it would have to find that listing them in order of predominance is false or misleading (section 403(a) of the act). Clearly, the applicable finding would have to be that the current method of listing sweeteners results in consumer deception, that is, as argued by the consumer and state government comments, by dispensing sweeteners throughout the ingredient list, manufacturers hide the total amount of sweetening ingredients added to a food. FDA has concluded, however, that this practice will not result in deception for two reasons.

First, because nutrition labeling will include a listing of total sugars, this practice will no longer provide a means of hiding the amounts of sweeteners added to the food. The consumer will be able to determine if a product has a high amount of sugars by looking at the nutrition label.

Secondly, from a nutritional standpoint, the amount of added sugars is not significant information when considering overall sugar content. It is the total sugars content that has nutritional importance. Again, this amount will be determinable from the nutrition label. Thus, FDA agrees with the comments that there is no scientific or public health reasons for singling out sweeteners for special treatment in the ingredient list. For these reasons FDA concludes that grouping of sweeteners is not necessary to prevent consumers from being misled and, therefore, FDA is not requiring such a step. Accordingly, FDA has deleted the proposed requirement for aggregate declaration of sweeteners (proposed § 101.4(b)(21)) from this final rule.

FDA points out that it has considered the other objections raised by industry to its proposal. As explained above, FDA clearly has authority under section 403(a) of the act to take the step it proposed. FDA advises that there would be alternative ways of addressing each of the other concerns that the industry comments raised. Because the agency has decided not to adopt proposed § 101.4(b)(21), however, it finds that there is no need to address each of those concerns in detail.

The agency received several other supporting and opposing comments addressing its definition of sweeteners (i.e., list of ingredients to be included in the definition of sweeteners for the purpose of this regulation) as discussed in the June 21, 1991, proposal (56 FR 28592 at 28608). Because the agency has reconsidered its position on the aggregate declaration of sweeteners in the ingredient statement, the issues raised in those comments are no longer pertinent and need not be addressed in this rulemaking.

19. Other comments recommended that FDA require the disclosure of artificial sweeteners on the principal display panel in addition to the ingredient list. These comments suggested that the label should read "Artificially sweetened" and should also bear warnings about artificial sweeteners being harmful to children and pregnant women. However, the comments did not provide information supporting their assertion that artificial sweeteners are specifically harmful to children and pregnant women.

The agency will not object to manufacturers voluntarily declaring on the principal display panel that the product is artificially sweetened. This voluntary declaration, however, only applies in those instances where "artificially sweetened" is not a part of the statement of identity of the food (e.g., artificially sweetened canned apricots) and, therefore, required to appear on the principal display panel. The agency is not aware of any evidence to support the assertion in the comments that artificial sweeteners are more harmful to children and pregnant women than to the general population. FDA has considered the safety of these ingredients as part of the food additive listing process. Where it has been presented with evidence that shows that it is necessary for the safe use of an artificial sweetener, FDA has required declarations. Such a declaration is provided for in 21 CFR 172.804, which requires that labels on foods that contain aspartame bear the statement "PHENYLKETONURICS: CONTAINS PHENYLALANINE." In addition section 403(o)(1) of the act requires that labels of foods containing saccharin bear the warning statement "USE OF THIS PRODUCT MAY BE HAZARDOUS TO YOUR HEALTH. THIS PRODUCT CONTAINS SACCHARIN WHICH HAS BEEN DETERMINED TO CAUSE CANCER IN LABORATORY ANIMALS." Both provisions require that such statements shall be located in a conspicuous place on the label as proximate as possible to the name of the food and shall appear in conspicuous and legible type in contrast to other printed matter on the label. As other artificial sweeteners are permitted for use in foods, the agency will prescribe the conditions under which those sweeteners may be safely used, including labeling or packaging requirements if deemed necessary by the agency to ensure the safety of such use. See section 409(c)(1)(A) of the act (21 U.S.C. 348(c)(1)(A)).

B. Lactose Labeling

In the June 21, 1991, proposal, the agency restated its policy on the declaration of lactose and advised that ingredient labeling regulations require the listing of lactose whenever it is used as an ingredient of food (56 FR 28592 at 28608).

20. One comment supported FDA's position against requiring label declaration of lactose when present as a component of an ingredient (e.g., whey, nonfat dry milk), because lactose intolerant consumers know to avoid milk and milk products. Another comment requested the establishment of regulations to require labeling products as "lactose free." This comment stated that the high percentage of the population that suffers from lactose intolerance warrants such a requirement.

The agency does not agree that the requested statement is needed because lactose intolerant consumers know to avoid milk and milk products. Furthermore, the comment did not present data to substantiate that lactose intolerant consumers need a "lactose free" declaration to determine which foods they can safely consume. Such information would be necessary for FDA to require a statement that a product is "lactose free." Thus, FDA is not requiring a "lactose free" declaration on products that do not contain lactose. However, the agency advises that manufacturers may voluntarily label a food as "lactose free," provided, of course, that the statement is true. Any product labeled as "lactose free" must not contain lactose as an ingredient or as a component of an ingredient and

should adhere to the provisions of 21 CFR 105.62 on hypoallergenic foods.

V. Labeling of Fresh Fruits and Vegetables

A. Pesticides

21. The majority of comments, citing concerns about health risks and the consumer's right to know, requested that the agency require manufacturers to disclose preharvest and postharvest pesticide use on fresh fruits and vegetables at the retail level. The comments expressed concern that, in the absence of pesticide labeling at the retail level, growers, packers, repackers, or distributors may indiscriminately use pesticides that are not permitted or are permitted only on specific fruit and vegetable commodities.

As discussed in the preamble to the June 21, 1991, proposal (56 FR 28592 at 28611), section 403(l) of the act only requires declaration of postharvest pesticides on the shipping container. Moreover, section 403(l) of the act specifically precludes the agency from requiring declaration of postharvest pesticides at the retail level. The comments favoring disclosure of preharvest and postharvest pesticide use did not provide any information not considered by the agency at the time of the proposal, nor did they provide viable solutions to the many compliance and enforcement problems that would arise if the agency acquired statutory authority to require pesticide labeling at the retail level. Moreover, the agency advises that the indiscriminate use of pesticides is illegal. Only uses specifically permitted by the Environmental Protection Agency under the Federal Insecticide, Fungicide and Rodenticide Act of 1988 (7 U.S.C. 136a-1) are legal. Thus, FDA has concluded that it will not seek statutory authority to require pesticide labeling by the retailer at this time.

B. Wax or Resin Coatings

The agency proposed to permit retailers to use appropriate collective (generic) names for ingredient labeling of wax or resin coatings on fresh produce (56 FR 28592 at 28611). Section 403(i) of the act provides for exemption from specific ingredient labeling when such labeling is impracticable or results in deception or unfair competition. Because of the constant change of produce items in retail establishments, FDA tentatively concluded that specific ingredient labeling of waxes and resins was impracticable (56 FR 28592 at 28613). In addition, under the proposal, packers and repackers unable to adhere to a constant pattern of wax or resin use on produce would be permitted to use collective names in ingredient labeling. Also in the June 21, 1991, proposal, FDA responded to a citizen petition (Docket No. 90P–0404) requesting the agency to permit: (1) Collective labeling of fresh produce by shippers; (2) ingredient labeling on plastic bags; and (3) the term "may" in ingredient labeling of wax or resin coating on fresh produce.

22. Although a number of comments supported the agency's proposal, several comments requested specific wax or resin coating ingredient declaration at the retail level because of health and safety considerations and because of the right of consumers to know what is in the foods they eat.

The agency recognizes that consumers have expressed health and safety concerns as they relate to the consumption of waxes and resins. Waxes and resins used on fresh produce have been accepted as food grade and therefore are considered by the agency to be safe ingredients. If the agency becomes aware that a particular wax or resin may be harmful to consumers, it will take appropriate action to ensure safe use of the wax or resin.

The agency further acknowledges that some consumers desire specific ingredient declaration of waxes and coatings, and that such declarations are generally required under section 403(i) of the act. However, section 403(i) of the act does not provide a "right to know" the ingredients of every food. It qualifies the requirement that each ingredient be listed (section 403(i)(2) of the act) by saying that to the extent that compliance with that requirement is impracticable or results in deceptive or unfair competition, FDA is to establish exemptions from the requirement by regulation (section 403(i)(2)). The comments did not provide evidence regarding retail marketing practices that contradicted the agency's tentative conclusion that specific ingredient labeling at the retail level is impracticable. Therefore, FDA has not been persuaded to change its tentative finding that specific ingredient declaration is impracticable, at the retail level. Accordingly, the agency concludes that specific ingredient declaration of waxes and coatings on fresh produce is impracticable and that the proposed exemption permitting use of collective terms by the retailer is appropriate.

23. Some of the comments that requested specific wax or resin coating label declaration also requested declaration of the fungicides applied in the waxes or coatings. These comments asserted that information on fungicides is important for health and safety considerations.

As discussed above, section 403(l) of the act specifically precludes FDA from issuing regulations requiring retail labeling for postharvest use of pesticides. Fungicides that may be applied with or without waxes or coatings are included in the category of postharvest-use pesticides, as provided in section 201(q) of the act (21 U.S.C. 321a(q)) and therefore are exempt from required declaration at the retail level. As previously stated, the agency does not plan to seek statutory authority to require pesticide labeling by retailers.

24. Many comments requested that domestic and foreign packers and repackers be exempted from specific ingredient labeling and allowed to use collective (generic) terms without first having to determine whether there is a "constant pattern" of wax or resin use on the produce. Several of the comments asserted that seasonal variation, product variation, coating variability, product destination, cost and availability of wax or resin coating, and the practice of commingling lots of variously coated fresh fruits and vegetables from different suppliers occur so frequently that packers and repackers would rarely, if ever, adhere to a "constant pattern" of use.

In addition, the comments stated that the packer or repacker who adheres to a "constant pattern" of use, and, therefore, is required to use specific wax or resin coating ingredient declarations, is at a competitive disadvantage when compared to packers or repackers who do not adhere to a constant pattern of use. The comments contended that unfair competition results because of the labeling and inventory costs required to maintain specific ingredient labeling as well as collective ingredient labeling for those instances when the packer does not adhere to a constant pattern of use. The comments further stated that the ordinary practice in the packing industry is to use prestenciled shipping containers that are labeled before they are packed. Thus, packers and repackers who adhere to a constant pattern of use and are required to list individual wax or resin ingredients would have to maintain a separate inventory of boxes prestenciled with the required ingredient information. The comments argued further that most packers often run two or three shifts per day, each with multiple lines packing various types of produce simultaneously. These comments concluded that the packers who adhere to a constant pattern of use would not only have to increase their packaging costs and inventory space but also

would have to increase their workforce and reorganize the packing process.

Other comments stated that the requirement to list specific ingredients on shipping containers if a "constant pattern" of use is determined is at odds with the proposal to use collective names at retail. Such a requirement would compel retail store personnel to categorize the specific wax or resin coating, because retail establishments will always be able to use generic labeling. These comments further maintained that it is unreasonable to expect produce clerks and store managers to understand ingredient label classification of waxes and resins and to label accurately the products with the appropriate collective name. These comments also contended that requiring produce personnel to classify waxes and resins for labeling purposes may ultimately cause erroneous labeling, resulting in misbranding of the product and misleading the consumer.

The agency requires ingredient labeling for wax or resin coatings on both domestic and imported fresh fruits and vegetables. The agency finds, based on information provided in the comments regarding industry practices, that the loss of specific lot identification because of commingling of variously coated produce while in bulk storage at the wholesale distributor level makes specific ingredient declaration impracticable. Proposed § 101.4(b)(25) (redesignated as new § 101.4(b)(22) in this final rule) provided for the use of collective terms by packers and repackers when a "constant pattern" of wax or resin ingredient use is not practicable. In light of information regarding industry practice provided in several of the comments, the agency concludes that it is likely that the great majority of packers and repackers, both foreign and domestic, will satisfy the conditions of impracticability required for exemption from specific ingredient labeling for wax and resin coatings. The agency further concludes that the small number of manufacturers who adhere to a constant pattern of use of wax or resin coatings may be at a competitive disadvantage because they will incur additional labeling and inventory costs in order to provide specific wax or resin ingredient labeling for a variety of fruits and vegetables. Similar costs will not be borne by the majority of packers and repackers, who do not adhere to a constant pattern of wax or resin use.

Section 403(i)(2) of the act provides that, in cases where specific ingredient labeling would be impracticable or result in deception or unfair competition, the packer or repacker may be exempted from such labeling. Because of industry practices previously discussed, the majority of packers and repackers will meet the requirements for exemption from specific ingredient declaration because of impracticability. In the agency's opinion, however, the few packers and repackers that would not be exempt from specific ingredient declaration due to impracticability would be placed at a competitive disadvantage if required to comply with section 403(i) of the act. Accordingly, the agency is revising proposed § 101.4(b)(22) to exempt all packers and repackers from specific ingredient labeling of wax and resin coatings. In reaching this conclusion, FDA also considered that consumers would not be disadvantaged by any loss of information if packers and repackers use collective term labeling of waxes and resins because retailers are permitted to use collective terms. Therefore, specific ingredient labeling of waxes and resins by the packer or repacker would not be provided to the consumer by the retailer.

25. Several comments requested that the agency revise proposed § 101.4(b)(25) to include dairy-based waxes within the category of animal-based waxes, e.g., "animal-based or milk-based" or "coated with animal-based wax (may include dairy product-based wax)." The comments cited the possibility of allergic reaction to products containing small amounts of dairy products and religious, ethnic, or dietary restrictions as the reasons for the request.

The agency advises that dairy-based waxes are included in the animal-based wax category. The agency believes that consumers understand that dairy products are animal-based, and that any dairy-based ingredients in waxes or resins would be included in an "animal-based wax" declaration. The agency further believes that the prescribed term "coated with animal-based wax" is adequate to provide the requested information to consumers wishing to avoid dairy-based products. The comments did not provide any basis for finding that the use of the term "animal-based" is not adequate to advise consumers with all the information they would need to avoid the product. Accordingly, FDA has not made the requested revision of the regulation.

26. Some comments objected to the term "food grade," stating that all ingredients are food grade, and that this term may give the consumer the impression that other ingredients are not "food grade." These comments also objected to the optional use of functional phrases, e.g., "to maintain freshness," in conjunction with the words "wax" and "coatings," because the comments believed that such terms are misleading or redundant.

The agency points out that the term "food grade" is an optional term and concludes that it should remain as such. The agency is not convinced that consumers will perceive that ingredients not designated as "food grade" are not food grade. On the contrary, the agency believes that the use of the optional term "food grade" will assure consumers who are concerned about wax or resin coatings that these ingredients have been accepted by the agency as "food grade" and, therefore, are considered to be safe ingredients.

The agency disagrees that the phrase "to maintain freshness" is misleading. Waxes and coatings do perform a preservative function, and this phrase is an acceptable means of stating that fact. Although the agency is not requiring the phrase "to maintain freshness" to describe the preservative function of waxes and resins (FDA believes that consumers generally recognize that this function is associated with the terms "wax" and "resin;" thus, for produce, the terms "wax" and "resin" fulfill the requirements of new § 101.22(j) and section 403(k) of the act with respect to the declaration of the preservative function), the agency will permit the phrase to be included in the wax or resin ingredient declaration.

27. A few comments suggested that the term "no wax and/or resin coating" should be required instead of no labeling when no wax or resin coating is present, to assure the consumer that the absence of labeling is not the result of the retailer's failure to label the presence of wax or resin coating.

The agency has the authority to require declaration of the absence of an ingredient in cases where it is implied that the ingredient has been used when in fact it has not been used. In such instances the lack of specific information would be misleading under sections 403(a) and 201(n) of the act. However, the comment did not provide information to substantiate that in the absence of a wax or resin declaration, consumers would believe that a wax or resin coating had been applied. Thus, the agency does not have the authority, in this instance, to require a "no wax or resin" declaration. However, the agency will not object to use of a "no wax or resin" declaration but does require that the statement is factual in all respects. Furthermore, the agency expects that packers, repackers, and retailers will comply with the statutory requirements and correctly label wax or resin coated fresh fruits and vegetables.

28. Other comments requested that the agency revise proposed § 101.4(b)(25) to: (1) Establish shellac or lac-based coatings as a separate category of wax or resin coatings; (2) modify the term shellac with the phrase "a coating made up of a secretion of the lac insect" to alert strict vegetarians; and (3) combine the categories beeswax and shellac-based because they are both insect-derived.

The agency has not been persuaded by the comments that the prescribed terms are inadequate to inform the consumer about wax and resin coatings, or that an additional category should be established to alert a limited population of consumers. FDA selected the collective terms that it proposed in the June 21, 1991, proposal to assist the consumer in avoiding certain products for reasons of religious, cultural, or ethnic dietary restrictions. These collective terms allow consumers to avoid certain foods, while providing the flexibility needed by retailers in prevailing market conditions to comply with the ingredient labeling requirement. Thus, the agency is not creating an additional category for beeswax and shellac (or lac-) based waxes. However, should a packer, repacker, or retailer voluntarily choose to use a more narrow descriptive term such as "vegetable based" or "beeswax and shellac based," or to name the specific wax or resin coating, the agency will not object to such use but does require that the declaration be factual.

29. Some comments suggested use of the term "petroleum based" as opposed to "mineral based" because it is factual, it is understood by consumers, and the term "mineral" may be misleading if associated with vitamins and minerals, particularly if nutrition labeling is provided by the retailer.

The agency agrees with the comments. Currently, in part 172 (21 CFR part 172), there are at least four multipurpose direct food additives that may be applied to fresh fruits and vegetables as a protective coating, and that the agency considers to be in the category "petroleum based." These are: White mineral oil (liquid petrolatum), § 172.878; petroleum wax, § 172.886; synthetic petroleum wax, § 172.888; and petrolatum, § 172.880. With the exception of white mineral oil, all have the term "petroleum" as part of their common or usual name. Therefore, the agency concludes that the term "petroleum based" is more accurate and informative in describing the nature and source of the wax coating than the term "mineral," which may be associated with inorganic substances rather than organic substances. Accordingly, FDA has revised new § 101.4(b)(22) (formerly § 101.4 (b)(25)) to reflect this change.

30. Two comments expressed concern that growers, packers, and repackers may begin to use coatings derived from certain gluten containing foods (i.e., wheat, barley, rye, oats, or millet), and that the prescribed generic terms would not adequately inform persons who must avoid these foods. The comments further asserted that retailers should not be allowed to treat cut-up fruits or vegetables with a gluten-based coating to enhance color and preserve freshness without declaring the use of such coating.

The agency is not aware of any commercially used coating derived from wheat, barley, rye, oats, or millet that may contain gluten. However, should such a coating be developed in the future, FDA would decide what measures are necessary to adequately protect those consumers who need to avoid gluten and to ensure the safe use of the coating.

In addition, retailers who coat fruits or vegetables are required to declare such ingredients in accordance with the provisions of section 403(k) of the act and § 101.4(b)(22).

31. Some comments that supported the use of self-serve plastic bags to identify wax or resin coating ingredients saw no difference between prepacked plastic bags with ingredient labeling and those plastic bags to be used by consumers from a roll. Further, they argued that, as opposed to information on signs, the information on plastic bags would give consumers added time for review during shopping and after leaving the store. Other comments opposed the use of self-serve plastic bags to provide ingredient declaration of wax or resin coatings because: (1) The consumer would not have the information before making the purchase decision; (2) it is difficult to read print on bags in a roll; (3) the consumer may not use the plastic bags specific to the produce or to the actual waxes applied to the products being purchased; and (4) the practice is not ecologically sound.

The comments supporting use of self-serve plastic bags to declare wax or resin coatings on produce at retail have not persuaded the agency that self-serve plastic bags available in the produce department meet statutory labeling requirements for ingredient declaration, meet expressed consumer needs, or can reasonably be managed at the retail store. As stated in the June 21, 1991, proposal, ingredient information on plastic bags available in the produce department would not provide consumers with this information at the time they actually make purchase decisions (56 FR 28592 at 28614). Further, the agency doubts that consumers would notice ingredient information because the bags are usually distributed in rolls. Thus, because the ingredient information would not be placed conspicuously and in such terms as to render it likely to be read and understood by the ordinary individual under customary conditions of purchase and use, the produce would be misbranded under section 403(f) of the act.

Furthermore, the agency believes that ingredient declaration on plastic bags could result in misleading consumers, especially when consumers may commingle different brands of the same produce or puzzle over which plastic bag to use for which produce. Unlike ingredient declaration on prepackaged fruits and vegetables, which is specific to the contents of that package, the agency cannot ensure that ingredient declaration placed on self-serve plastic bags would be used for the specific fruit or vegetable for which the bags were intended. Thus, FDA affirms its tentative finding and concludes that wax or resin coating ingredient labeling limited to self-serve rolls of plastic bags in the produce department does not meet the statutory requirement of section 403(f) of the act and, therefore, is not an acceptable alternative of ingredient declaration of waxes and resins.

32. Several comments requested that the agency reconsider its decision and permit retailers to use the term, "may have been treated with wax or resin coatings," on produce labels. The comments compared the concept to "and/or" labeling of fats and oils.

The agency believes that there is an inherent difference between the terms "may have been treated * * *," with its inherent suggestion that the food may or may not contain the wax, and "and/or." As discussed in the June 21, 1991, proposal, the suggestion that a food may contain a wax would be of virtually no use to consumers because it does not advise them whether the produce has a wax or resin coating or identify the coating used. On the other hand, "and/or" labeling informs the consumer that one or more of the ingredients declared is definitely present in the product. Thus, the agency is not granting the request to allow the term "may have been treated * * *" in the declaration of wax or resin coatings. However, the agency points out that it has allowed in new § 101.4(b)(22) for the use of "and/or" labeling in declaration of wax or resin coatings (e.g., "coated with vegetable-, petroleum-, beeswax-, and/or shellac-based wax or resin") because it

adequately informs the consumer of the generic category of wax or resin coating as well as provides the flexibility needed by industry. These prescribed terms are sufficiently general that if several different kinds of wax or resin coatings become commingled in different lots, the produce would still be factually and informatively labeled.

33. Several comments requested that the agency establish more rigid requirements with respect to format, terminology, and letter size for wax or resin label declaration. These comments expressed the belief that the proposed requirements were not adequate to inform the consumer.

The comments did not provide any evidence to support their claim that the requirements as proposed will not result in labeling that will adequately inform the consumer regarding wax or resin coating. Consequently, the agency disagrees with these comments and concludes that the requirement that labeling be displayed prominently and in a conspicuous manner with lettering at least one-fourth of an inch high is adequate to inform the consumer.

34. A few comments requested that FDA require that the sign for each commodity be placed next to the bin bearing that commodity. These comments contended that one sign in the produce department covering all affected produce would not adequately provide point-of-purchase information for the various items sold throughout the department. Comments opposing the requirement of individual signs next to each commodity stated that such a practice would ultimately lead to misbranding because of the retail practice of moving bins, rearranging produce displays, and the likelihood of consumers knocking down such signs.

In the June 21, 1991, proposal, the agency proposed in § 101.4(f) to require that ingredients that must be declared in labeling because there is no label for the food (display of written, printed, or graphic matter upon the immediate container of any article), be listed prominently and conspicuously by their common or usual name. The agency did not, however, propose requirements with regard to the number of signs or countercards or the placement of such labeling in produce departments because the arrangement and size of produce departments is not consistent from one retail establishment to another. In cases where the produce department is confined to a small area, one sign or counter card may be sufficient to adequately inform the consumer regarding the use of wax or resin coatings as produce ingredients. However, where the produce department covers a large area, one sign may not be adequate. The agency believes that retailers should be permitted to determine the appropriate placement of signs and counter cards to meet ingredient labeling requirements in each particular establishment. However, the agency advises that enforcement action may be taken against retail establishments where wax or resin ingredient declarations are not prominently and conspicuously displayed.

35. One comment stated that the agency should not specify the manner of labeling for wax or resin coated produce or set rigid type size requirements for sign lettering placed on bulk bins, i.e., one-fourth inch type size, as proposed in § 101.100(a)(2)(ii). The comment asserted that such rigid standards would stifle innovation and limit the creativity of grocers in finding new ways to provide useful information to consumers.

The agency disagrees with the comment that the proposed labeling requirements would stifle retail creativity. The proposed minimum type size requirement will help to ensure that consumers with a wide range of visual acuities will be able to read the written information. Moreover, such written information will comply with requirements provided under section 403(f) of the act. Further, the type size requirement does not preclude retailers from providing brochures, electronic signs, computer screen displays, or using other media and methods to inform consumers in addition to the sign required in § 101.100(a)(2).

36. One comment requested clarification on whether the minimum letter size requirement of one-fourth of an inch referred to upper case or lower case when both lettering types are used.

The agency advises that, as with other minimum lettering size requirements, the minimum size requirement of one-fourth of an inch for labeling of wax or resin coating ingredient labeling refers to the height of the lower case "o" when both upper and lower case lettering is used, as established in § 101.105(h)(2).

VI. Source Labeling

A. General

FDA stated in the June 21, 1991, proposal that declaration of the food source in the common or usual name of all foods would not be required.

37. Many consumer comments responding to the proposal requested that the agency reconsider its position and require that the specific source of an ingredient be declared as part of its common or usual name in the list of ingredients.

These comments repeated requests that the agency had already evaluated when developing the June 21, 1991, proposal and did not present new information. As previously discussed (56 FR 28592 at 28603), several of these comments expressed a desire to avoid certain ingredients (e.g., corn-derived sweeteners), while others stated that consumers should be fully aware of what is in the food they eat.

FDA appreciates consumer needs and concerns about source labeling and points out that source labeling is required as part of the common or usual name in instances where such information has a material bearing on the purchase of a food, where such information describes the basic nature of the food, or where consumers may be misled without such information (§ 101.4(a)(1) and 102.5(a)). For FDA to require declaration of the source of all ingredients, it would have to amend the common or usual name of those ingredients that do not currently include their source. As explained in the June 21, 1991, proposal (56 FR 28592 at 28603), such a requirement would require enormous resources, and the agency does not have such resources available. Moreover, many of these ingredients are so well known that most consumers understand the source of the ingredient from its name. Consequently, FDA reaffirms its conclusion that it is not feasible or necessary to establish a general requirement for source information in the common or usual names of all foods.

B. For Specific Foods—Gluten Labeling

38. FDA received several comments from consumers affected with celiac sprue, a medical condition that results in damage to the absorptive surface of the intestine when gluten (a protein fraction of cereal grains) is ingested. These comments strongly requested source declaration, particularly for all protein hydrolysates (i.e., flavor-related and nonflavor-related protein hydrolysates) and modified food starches produced from wheat, barley, rye, oats, and millet which commonly contain gluten. Alternatively, these comments requested that FDA establish regulations that would allow manufacturers to state that a product is "gluten free" without misbranding the food.

The agency acknowledges the desire of those individuals affected with celiac sprue to know what products contain gluten. As with other ingredients combined to make a finished food, declaration of gluten when added as an

ingredient to a food is required. Literature reviewed by the agency suggests that the two most commonly used forms of gluten are derived from corn and wheat (Ref. 45). Sections 184.1321 and 184.1322 (21 CFR 184.1321 and 184.1322) establish the terms "corn gluten" and "wheat gluten," respectively, as the common or usual names for declaration of these ingredients.

In this final rule, FDA is requiring source declaration in the common or usual name of all protein hydrolysates, including those that are made from sources that may contain gluten, because the source is essential to describe the basic nature of the ingredient. In the June 21, 1991, proposal, the agency advised that protein hydrolysates used for nonflavor-related purposes should also be declared by appropriate common or usual names in accordance with the provisions of proposed § 101.22(h)(7), which describes requirements for the declaration of protein hydrolysates used for flavor-related purposes (56 FR 28592 at 28600). For reasons discussed in section VIII.A. of this document, the agency is incorporating that position into the regulation. Therefore, the requirement for source declaration in the common or usual name of protein hydrolysates used for flavor-related purposes has been transferred from § 101.22(h)(7) to new § 102.22(a) and now applies to declaration of protein hydrolysates used for flavor-related as well as nonflavor-related purposes. The agency believes that this requirement will assist consumers who wish to avoid gluten.

With respect to modified food starch, the agency does not believe that source declaration is required to inform consumers about gluten content. Modified food starches (21 CFR 172.892) are products of the treatment of any of several grain- or root-based starches with small amounts of chemical agents, which modify the physical characteristics of the source starches to produce desirable properties. Corn starches are the dominant starches used in the United States (Ref. 50). As stated in the comments, consumers with celiac sprue must abstain primarily from gluten derived from wheat, oats, barley, millet, and rye. Corn as a source of gluten was not mentioned in the comments as one to be avoided.

More importantly, the starch component of the source food is separated from the protein (i.e., gluten) component through starch isolation techniques (Ref. 50). Once the starch has been isolated, it is modified and added to food as an ingredient. Therefore, irrespective of the source of the modified food starch, the gluten (protein) component is removed and therefore should not be a problem for gluten intolerant consumers. The comments did not provide evidence that modified food starch causes adverse health consequences as currently used. Therefore, the agency is not requiring source declaration for modified food starch.

The agency advises that even though it has not specifically defined "gluten free," this phrase can be used on foods provided that when as used it is not false or misleading. The term "gluten free" may be misleading when the food ordinarily contains no gluten (e.g., modified food starch). Further, it is the agency's understanding that "gluten free" foods labeled as such may be found in the special dietary sections of some food stores and on a very limited number of products more generally available. Therefore, the agency has advised (Refs. 51 and 52) that foods labeled "gluten free" that purport to be or are represented for special dietary use should adhere to the provisions for hypoallergenic foods in § 105.62 by declaring the common or usual name, and the quantity or proportion, of each ingredient (including spices, flavorings and noncertified color additives) when the food is fabricated of two or more ingredients. Additionally, under § 105.62(b), the name of the food or of its ingredients must be qualified to reveal clearly the specific plant or animal source of the food or ingredient. Moreover, an informative statement of the nature and effect of any treatment or processing of the food or any ingredient thereof must be declared if a change in the allergenic property results from such treatment or processing (§ 105.62(c)).

FDA will consider establishing a definition for "gluten free" if petitioned with sufficient information, including an adequate analytical methodology for food analysis.

C. Labeling of Foods Characterized as "Nondairy" that Contain Caseinates

In the June 21, 1991, proposal, the agency identified some food products that are marketed as dairy product substitutes and that bear labels that include the statement "nondairy," but that contain a caseinate milk derivative. FDA believes that the labeling of such products may lead consumers to think that the caseinates are not milk derived. Thus, the agency proposed in § 101.4(d) that wherever "nondairy" statements appear on the label of a product that contains a milk derivative, the source of the milk derivative must be declared in the ingredient statement.

39. The majority of comments that addressed this issue supported the agency's proposal. However, several comments recommended that the agency revise § 101.4(d) to require that the term "caseinate milk derivative" be declared after the term "nondairy" on the principal display panel, as well as in the ingredient list.

The agency disagrees with the latter comments. The agency does not believe that requiring the additional declaration on the principal display panel is justified. FDA believes that the proposed requirement to declare the source of the milk derivative in the ingredient list will adequately protect consumers who wish to avoid milk-derived ingredients. The comments in question did not provide evidence to show that the ingredient list declaration would not be adequate. Therefore, the agency is not requiring source declaration on the principal display panel.

40. One comment recommended that the source identification requirement of caseinates as milk derivatives in foods labeled as "nondairy" be extended to foods that do not bear a "nondairy" label. However, the comment offered no rationale for this recommendation.

The agency disagrees with the recommendation. In the absence of a "nondairy" label declaration, there is no basis to suggest that the consumer would be led to believe that the food was nondairy. The declaration of the specific name of the caseinate in the ingredient statement would not be misleading and complies with regulations for ingredient labeling. Thus, the agency is not requiring source information in the name of the caseinate if the product does not bear a "nondairy" claim.

41. Other comments recommended that State laws that require "nondairy" labeling of products with caseinates be preempted for health reasons.

The agency disagrees with this suggestion. The comments did not provide information on which the agency could make a finding that the term "nondairy" on products that contain caseinates would create health concerns if the products' labeling also declares, in the ingredient statement, that the caseinate is milk-derived. The latter statement would adequately inform consumers, wishing to avoid milk-derived products, of the presence of a milk-derived ingredient. Accordingly, the agency is requiring, as proposed, that products that bear a "nondairy" claim and contain caseinates, must declare in the ingredient statement that the caseinate is milk-derived.

D. Nomenclature for Sweeteners

42. One comment requested source labeling for sweeteners. This comment stressed that source labeling would allow persons with specific food allergies to avoid these ingredients in finished foods. This comment further stated that corn, specifically, is of concern to Jews observing dietary laws during Passover.

The evidence presented by the comment lacked supportive scientifically verifiable data and thus, has not persuaded the agency to modify its tentative finding that allergic reactions to sweeteners, particularly corn-derived sweeteners, do not represent a major health concern in the United States. In the absence of such evidence, the agency is not requiring inclusion of the food source in the names of sweeteners. However, the agency acknowledges the concern expressed by consumers about source labeling, particularly for corn sweeteners, for other than health reasons. Accordingly, as proposed, the agency is amending §§ 168.110(b) and 168.111(c) to provide for voluntary declaration of the food source in the naming of these sweeteners, as is currently allowed for glucose sirup (§ 168.120 (21 CFR 168.120)) and dried glucose sirup (§ 168.121 (21 CFR 168.121)). Because the agency is not requiring declaration of the food source in the naming of these sweeteners, it encourages consumers wishing to avoid certain sweeteners for religious or other reasons to familiarize themselves with the names of these sweeteners and look for these names in the ingredient lists.

43. Another comment requested clarification regarding nomenclature appropriate for commonly used nonstandardized sweeteners, such as corn sirups with varying degrees of sweetness intensity (dextrose equivalence) and in varying forms (dried, powdered, and liquid). The comment requested that names such as "corn sirup" and "corn sirup solids" be permitted instead of the common or usual name of the ingredient or the precise form in which the ingredient was incorporated into the food. The comment maintained that "corn sirup" and "corn sirup solids" would be better understood and more recognizable by consumers than the technical common or usual names.

The agency rejects this comment. The requested terms "corn sirup" and "corn sirup solids" are currently used as alternative names, designating source, for standardized sweeteners provided in §§ 168.120 and 168.121. They are specific to those ingredients and, therefore, not appropriate for collective declaration of nonstandardized sweeteners. Furthermore, consumers have consistently requested specific ingredient labeling information rather than the use of collective terms when asked to comment on several food labeling issues, including labeling of sweeteners.

Moreover, under section 403(i) of the act, a food that is fabricated from two or more ingredients is misbranded unless the label bears the common or usual name of each such ingredient. The act also states that the agency is to provide for exemptions if compliance with this requirement is impracticable or results in deception or unfair competition. The comment did not present evidence upon which FDA could make a finding that the declaration of nonstandardized sweeteners, by their common or usual names, would be impracticable or would result in deceptive or unfair competition. Accordingly, the agency is denying the comment's request to permit such names as "corn sirup" instead of the common or usual name of the nonstandardized sweetener. As discussed in the proposal, persons interested in further guidance on appropriate names for nonstandardized sweeteners should refer to parts 172, 180, 182, and 184 (21 CFR parts 172, 180, 182, and 184).

VII. Percentage Ingredient Labeling

FDA proposed in the June 21, 1991, proposal to codify in § 101.4(e) its voluntary percentage labeling policy, which permits manufacturers to declare voluntarily percentages of ingredients if the information is not misleading and is truthful in all respects.

44. Several industry comments acknowledged that in instances where an ingredient is prominently declared, either through identity or other label information, or where the ingredient has a market appeal or is used to make a claim, percent ingredient labeling should be required. However, these comments also suggested that voluntary percentage ingredient labeling has the potential to confuse and mislead the consumer because too much information can distract consumers from the more important nutrient content information now mandated for all food labels. These comments further stated that confusion could be generated if only some manufacturers declare ingredient percentages. These comments asserted that voluntary percent labeling is unnecessary in light of the new nutrition labeling regulations and is not important to consumers. One comment further expressed concern that percentage ingredient labeling will eventually become mandatory for all foods. This comment requested assurance from FDA that voluntary percentage ingredient labeling would not become mandatory.

The agency is not convinced that voluntary percentage ingredient declaration would lead to consumer confusion. FDA has permitted manufacturers to declare voluntarily the percentage of ingredients, and it does not have information to indicate that consumer confusion has occurred as a result of such declarations. In addition, the majority of comments on this issue stated that it was appropriate for FDA to establish a uniform method of declaration for those manufacturers who choose to use percent ingredient labeling.

Furthermore, the agency believes that this information could educate consumers as to the individual contribution of a particular ingredient in the finished food, thereby assisting them in planning their diets. Consumers have the ability to discern and understand labeling information that is presented in a uniform, clear, and concise manner. Therefore, the agency is issuing new § 101.4(e) to establish a uniform method for voluntary percentage declaration of ingredients.

FDA is not requiring general percentage labeling of all ingredients in all foods. Although the agency cannot give assurances regarding the future, it is not at this time seeking authority to require such percentage ingredient labeling. The agency emphasizes, however, that the percentage of characterizing ingredients must be declared, as provided in § 102.5(b), when the proportion of such ingredients has a material bearing on the price or consumer acceptance of the food, or when there may be an erroneous impression that the ingredients are present in an amount greater than is actually the case.

VIII. Flavors, Colors, and Spices

A. Label Declaration of Protein Hydrolysates

Protein hydrolysates, which include acid hydrolyzed and enzyme hydrolyzed proteins from plant and animal sources, and autolyzed yeast extracts, are used in many foods for a variety of functions, including as formulation aids, leavening agents, stabilizers, thickening agents, nutrient supplements, protein sources, flavorings, and flavor enhancers. Current regulations do not exempt protein hydrolysates from ingredient declaration when used for purposes other than flavoring. The practice

among some in industry has been to declare protein hydrolysates used for flavor-related purposes, such as flavor enhancement, as "flavorings" or "natural flavors."

In the June 21, 1991, proposal, the agency reached several tentative conclusions with regard to label declaration for protein hydrolysates used for flavor-related purposes. After reviewing available literature and technical data, FDA concluded that when protein hydrolysates are added to foods as flavorings, they also function as flavor enhancers. The agency pointed out that the act does not exempt flavor enhancers from required label declaration. Consequently, the June 21, 1991, proposal provided that any protein hydrolysate used in a food as a flavoring must be declared by its common or usual name.

As required by § 102.5(a), the common or usual name of a food should adequately describe its basic nature or characterizing properties or ingredients. The agency believes that some terms currently used for declaration of protein hydrolysates, e.g., "hydrolyzed vegetable protein" or "hydrolyzed animal protein," do not adequately describe their basic nature or characterizing properties because protein hydrolysates from different sources have different functional characteristics. Accordingly, in the June 21, 1991, proposal, FDA tentatively concluded that declaration of the protein source is necessary to describe accurately the nature of the protein hydrolysate, and proposed that it be included in the common or usual name. Furthermore, the agency stated that source declaration of protein hydrolysates is a material fact for consumers wishing to avoid certain foods for religious or cultural reasons.

In addition, FDA responded to the citizen petition submitted by the International Hydrolyzed Protein Council (the Council) in 1985. This petition requested that the agency revoke § 101.35 because the regulation is obsolete and does not include many of the protein hydrolysates presently used in foods. The agency agreed with the Council and proposed to delete § 101.35 from the regulations in the June 21, 1991, proposal.

FDA also tentatively found that there was no public health basis for requiring the declaration of free glutamates that occur as components of protein hydrolysates. However, comments on the June 21, 1991, proposal have raised other issues not related to public health concerning the declaration of glutamates. FDA did not consider these issues in the June 21, 1991, proposal. After evaluating the information presented in these comments, FDA has tentatively concluded that the phase "(contains glutamate)" is necessary to describe adequately the basic nature of certain protein hydrolysates and, thus, is proposing elsewhere in this issue of the **Federal Register** that this phrase be part of the common or usual name of certain protein hydrolysates. This action will, consequently, provide for the declaration of free glutamates as components of certain protein hydrolysates.

In the June 21, 1991, proposal, the agency did not include regulations for determining appropriate common or usual names for protein hydrolysates used for nonflavor-related purposes. Nevertheless, the agency did advise that protein hydrolysates used for nonflavor-related purposes should be declared in accordance with the provisions of proposed § 101.22. After reviewing the comments, however, the agency concluded that it is more appropriate to establish regulations that provide general requirements for the declaration of all protein hydrolysates and not just those used for flavor-related purposes. This will minimize confusion regarding appropriate common or usual names for the various kinds of protein hydrolysates. The agency also concluded that establishing general requirements for protein hydrolysates used for nonflavor-related purposes was a logical outgrowth of the June 21, 1991, proposal. Accordingly, the agency has transferred provisions of proposed § 101.22 regarding the common or usual name designation of protein hydrolysates used for flavor-related purposes to new § 102.22, and extended the requirements to include protein hydrolysates used for nonflavor-related purposes.

The agency has also concluded that highly hydrolyzed protein hydrolysates can be differentiated (as discussed below) from protein hydrolysates that may be mildly, lightly, or partially hydrolyzed (i.e., those types used for nonflavor-related purposes). Unlike highly hydrolyzed protein hydrolysates, protein hydrolysates that are not highly hydrolyzed may retain the functional effects and allergenic potential of the source protein because the source protein is still structurally intact to a substantial degree. Therefore, the agency has concluded that the inclusion of the protein source in the common or usual name of mildly, lightly, or partially hydrolyzed protein hydrolysates is also a material fact because this information is required by certain (allergic) individuals in order to make purchase decisions.

The agency's evaluation and summary of the comments received in response to the June 21, 1991, proposal follow.

45. The agency did not receive any comments objecting to the required ingredient declaration of protein hydrolysates when added to foods for flavor-related purposes. Therefore, as proposed, the agency is establishing in new § 101.22 a requirement for declaration of a hydrolyzed protein by its common or usual name in the ingredient list in order of predominance by weight when added to a food for flavoring or flavor-related functions. The agency points out, however, that provisions for specific declaration and acceptable names for protein hydrolysates have been transferred from proposed § 101.22(h)(7) to new § 102.22(a).

46. A number of comments requested more detailed source declaration, such as identification of milk-derived ingredients and specific origin of vegetable-derived protein hydrolysates. The two primary reasons cited in the comments for requesting source declaration were: (1) Religious or cultural dietary concerns; and (2) allergy, food intolerance, or sensitivity to the source protein. Other comments expressed the belief that the source of the protein should also be required in the declaration of the protein hydrolysate used for nonflavor-related purposes to protect those individuals who are allergic to certain source proteins. These comments stated that the potential for an allergic reaction is greater for nonflavor-related protein hydrolysates because these protein hydrolysates may be partially, mildly, or lightly hydrolyzed proteins. Unlike highly hydrolyzed proteins; partially, mildly, or lightly hydrolyzed proteins retain their capacity to induce allergic reactions because peptides from their source protein are significantly longer than those present in highly hydrolyzed proteins.

Several comments stated that source declaration should be limited to the terms "animal" or "vegetable," and that these generic terms would be sufficient for individuals wishing to avoid certain foods for religious or cultural reasons. These comments further stated that individuals wishing to avoid specific ingredients of animal or vegetable origin could do so by relying on the generic source declaration of "animal" or "vegetable."

The agency believes that the requirements set forth in §§ 101.22 and 102.22 are sufficient to inform consumers about the nature of the protein hydrolysate and, therefore, concludes that additional declarations

(e.g., milk-derived) are not necessary. However, the agency finds significant merit in those comments requesting that the source declaration be required for protein hydrolysates used for nonflavor-related purposes. The agency agrees with the comments that protein hydrolysates used for nonflavor-related purposes (i.e., partially hydrolyzed protein hydrolysates) may retain the allergenic potential of the source protein. Thus, the agency concludes that the inclusion of the name of the source in the common or usual name of the ingredient represents a material fact under section 201(n) of the act because individuals who are allergic to a specific food need to know when it is present as an ingredient in a food in order to make informed purchase decisions.

Furthermore, as the agency determined that source declaration as part of the common or usual name of highly hydrolyzed proteins is necessary to describe the basic nature of the ingredient because of inherent differences in the nature (amino acid profiles) of the source protein, it also finds that source declaration as part of the common or usual name of partially hydrolyzed proteins is necessary to describe the basic nature of the ingredient. Further, in order to provide additional guidance on the declaration of nonflavor-related protein hydrolysates, the agency is also advising that it is appropriate to use optional terms such as "partially," "lightly," or "mildly" in the declaration of protein hydrolysates that are not highly hydrolyzed. For example, the common or usual name of a protein hydrolysate that is not highly hydrolyzed may be declared as "hydrolyzed (source) protein" or "partially hydrolyzed (source) protein."

As stated in the June 21, 1991, proposal, the agency has advised that manufacturers should determine appropriate common or usual names for protein hydrolysates used for nonflavor-related purposes according to the provisions of proposed § 101.22. Upon consideration of the comments, however, the agency finds that it is necessary to establish regulations for the common or usual names of protein hydrolysates used for nonflavor-related purposes to ensure accurate, uniform, concise, and appropriate ingredient declarations for all protein hydrolysates. Accordingly, the agency has extended provisions for specific declaration and acceptable names for protein hydrolysates in proposed § 101.22 to cover all protein hydrolysates, and has transferred the provisions to new § 102.22.

With regard to the use of generic terms, the agency believes that generic terms like "animal" or "vegetable" do not adequately describe the basic nature or characterizing properties of the protein hydrolysate nor distinguish between the several types of source proteins in each general class of ingredients; therefore, they do not comply with § 102.5(a). As required by § 102.5(a), the common or usual name of an ingredient must describe, in as simple terms as possible, the basic nature of the food or its characterizing properties. As discussed in the proposal, hydrolyzed protein from wheat gluten and hydrolyzed protein from soy are different proteins, with significantly different amino acid profiles and functional properties. The amino acid profile, or composition, of the source protein describes the basic nature of the protein hydrolysate and determines the different levels of free amino acids released upon hydrolysis. In addition, the specific amino acids present in a source protein influence the flavoring ability of the protein hydrolysate at different stages of hydrolysis. Therefore, hydrolyzed wheat protein and hydrolyzed soy protein would not be distinguished accurately by a generic name.

Thus, generic source labeling using the terms "animal" or "vegetable" would not fully comply with § 102.5(a). The agency concludes that the declaration of the food source of a protein hydrolysate is essential to describe the basic nature of the protein hydrolysate, and that the food source is a significant determinant in the hydrolysate's eventual use in a food. Therefore, the food source should be a part of the common or usual name. The agency concludes further that the failure to identify the specific food source in the declaration of a protein hydrolysate causes the food to be misbranded because the declaration would not comply with the requirements of § 102.5(a) of the regulations and sections 201(n) and 403(a) of the act. The requirement for identification of the food source of a protein hydrolysate in proposed § 101.22(h)(7) is codified in new § 102.22(a).

47. One industry comment requested that FDA modify proposed § 101.22(h)(7) by providing that protein hydrolysates obtained from wheat gluten and other wheat sources be called "hydrolyzed wheat protein." The comment argued that once hydrolyzed, wheat gluten loses its specificity and is no longer wheat gluten because the carbon and nitrogen bonds holding the amino acids together are broken, leaving small peptides and amino acids. Therefore, the comment asserted, the term "hydrolyzed wheat protein" is more factual, adequately describes the nature of the ingredient, and is not misleading to consumers.

FDA recognizes that the hydrolysis of any protein source will produce small peptides and release certain amino acids, such that the hydrolyzed protein will not be identical structurally and functionally to the source protein. The amino acid profiles of the source protein and its hydrolyzed product, however, will be the same. Although wheat gluten is the principal protein component of wheat, there are other proteinaceous components of wheat that may not be defined specifically, as is gluten, but can serve as sources for hydrolyzed proteins. Furthermore, the agency believes that wheat gluten is generally accepted by consumers and industry as a differentiated wheat protein that meets the requirements of § 184.1322. Therefore, in the agency's opinion, when wheat gluten is used as a source of a hydrolyzed protein, the correct name of the ingredient is "hydrolyzed wheat gluten." Accordingly, the agency is not granting the comment's request. However, when other wheat components are used as sources of hydrolyzed proteins, the ingredient shall be declared as "hydrolyzed wheat protein."

48. Several comments asserted that source declaration for highly hydrolyzed proteins is not necessary because the source protein is so decharacterized in these products that its allergenic potential is no longer present.

The agency concurs with the comments' assertion that allergic, food intolerant, or sensitivity reactions are unlikely to occur from consumption of highly (acid) hydrolyzed proteins used in foods primarily for flavoring and flavor enhancement because the high degree of hydrolysis generally employed in the manufacture of these protein hydrolysates is likely to destroy the allergenic potential of the source protein (Ref. 4). Thus, the agency concludes that source declaration for highly hydrolyzed proteins is not necessary for the protection of individuals who are allergic, food intolerant, or sensitive to the source protein. However, as stated earlier, the food source of a protein hydrolysate is basic to describing the nature of the protein hydrolysate and, therefore, the agency is requiring the declaration of the food source as part of the common or usual name.

49. Many comments urged the agency to require declaration of the MSG (glutamate) component in protein hydrolysates for various reasons.

Because the agency is proposing, elsewhere in this issue of the Federal Register, to require, in specific situations, the declaration of glutamate as a component of protein hydrolysates, these comments and the agency's response will not be discussed here. However, a full discussion of this issue is presented in the above-referenced proposal.

50. In responding to the June 21, 1991, proposal, several comments indicated that differences exist among acid-hydrolyzed protein hydrolysates, enzyme-hydrolyzed protein hydrolysates, partially hydrolyzed protein hydrolysates, and autolyzed yeast extracts. These comments argued that the agency should make distinctions in the labeling of these different substances because some are used almost exclusively for flavor enhancement, sometimes substituting for MSG; others are primarily flavors rather than flavor enhancers but act in both capacities; and still others are neither flavors nor flavor enhancers but function as formulation aids, leavening agents, stabilizers, thickening agents, nutrient supplements, and protein sources. In conjunction with the nonflavor-related functions, some comments stated that the agency should address separately the labeling of a class of protein hydrolysates variously termed "partially," "mildly," or "lightly" hydrolyzed proteins, which primarily serve functions in food other than as flavor enhancers and/or flavorings.

The agency believes that the requirements in § 102.22 provide ample guidance for label declaration of protein hydrolysates in instances where confusion may have existed. As provided, the common or usual name of any protein hydrolysate will include the protein source. This requirement is necessary to describe the basic nature or characterizing property of the ingredient. The agency will also permit manufacturers to use such terms as "partially," "mildly," or "lightly" to describe protein hydrolysates that are not highly hydrolyzed. The agency believes that appropriate standards exist to allow it to distinguish between commercially-available highly hydrolyzed protein hydrolysates and those protein hydrolysates; variously termed "partially," "mildly," or "lightly" hydrolyzed; that are not used for flavor-related purposes. Highly hydrolyzed proteins can be defined as those whose ratio of α-amino nitrogen (AN) to total nitrogen (TN), determined by using the tests for "Acid Hydrolyzed Proteins" set forth in the "Food Chemicals Codex", 3d ed., 1st Supp. (1983), is greater than 0.62 (AN:TN > 0.62) (Ref. 53). Proteins that are not highly hydrolyzed would have an AN:TN ratio of less than 0.62 (AN:TN < 0.62) and may be declared by using such terms as "partially," "mildly," or "lightly" (e.g., "Partially hydrolyzed (source) protein"). The comments did not offer any analytical information or methodology, however, to assist the agency in distinguishing between partially, mildly, or lightly hydrolyzed proteins.

51. The agency did not receive any comments objecting to the proposed deletion of § 101.35, which provides guidelines for label declaration of MSG and other hydrolyzed vegetable proteins. Therefore, as proposed, the agency is deleting § 101.35 from its regulations.

B. Labeling of Other Flavors, Color Additives, and Spices

Before passage of the 1990 amendments, the act provided that flavorings, colorings, and spices could be declared collectively using the terms "flavorings," "colorings," and "spices." However, the 1990 amendments amended section 403(i) of the act to require that certified color additives be declared by their common or usual names and not be designated by the collective term "colorings." As a result of this change in the statute, each certified color additive used in or on a food must be declared by its common or usual name, but noncertified color additives may still be declared collectively. Congress did not revoke the exemption from required declaration for flavorings and spices.

In response to this new statutory authority, FDA proposed § 101.22(k) which details how color additives are to be declared in the ingredient list. The agency also proposed to permit the use of abbreviated names for certified color additives. Over the last several years, FDA has allowed manufacturers who voluntarily declare certified color additives to use abbreviated names. Although the agency believed that the common or usual names by which the color additives are listed in parts 74 and 82 (21 CFR parts 74 and 82) were the most appropriate names for identifying these color additives, it also felt that a provision that permitted the use of abbreviated names might encourage more manufacturers to voluntarily declare these color additives. The agency concluded that such a practice would provide more information to consumers than use of the collective term, which before the 1990 amendments, satisfied the requirements of the act.

On January 28, 1983, FDA issued an advisory opinion permitting the use of abbreviated names of certified color additives in response to a citizen petition submitted by the Grocery Manufacturers of America, Inc. (Docket No. 78P–0164). FDA subsequently proposed, in the **Federal Register** of June 6, 1985 (50 FR 23815), to incorporate that advisory opinion into its regulations. A final rule, however, has not yet published.

With the passage of 1990 amendments including the requirement that certified color additives used in foods be declared by their common or usual names FDA saw an opportunity to finalize the 1985 rulemaking. Given that under section 403(i)(2) of the act the listing of certified color additives will be required on food labels, the agency tentatively concluded that manufacturers should have the option to use abbreviated names for declaring the certified color additives. Accordingly, in the June 21, 1991, proposal, the agency proposed to continue the option to use abbreviated names because consumers have come to recognize and understand these names for color additives. Furthermore, the agency recognized that the use of abbreviated names has some advantage for industry because they consume less label space.

In the proposal, the agency solicited comments on whether certified color additive lakes should also be permitted to be declared using abbreviated names.

52. A comment from the Canadian government requested that the agency modify proposed § 101.22(k) to provide for the use of alternative names (such as tartrazine, allura red, erythrosine, sunset yellow FCF, brilliant blue FCF, indigotine, and fast green FCF) instead of the U.S. names (FD&C Yellow No. 5, FD&C Red No. 40, FD&C Red No. 3, FD&C Yellow No. 6, FD&C Blue No. 1, FD&C Blue No. 2, and FD&C Green No. 3, respectively) or to allow alternative names to be included in parentheses after the U.S. names. The comment stated that this approach would be consistent with provisions of the U.S. Canada Free Trade Agreement.

The agency believes that the common or usual names of certified color additives used in food, such as FD&C Blue No. 1 and FD&C Yellow No. 5, are recognized by consumers and broadly understood to be names of artificial colorings when they appear in an ingredient list. In addition, the certified color additives meet certain specifications, as provided in parts 74 and 82. The alternative names suggested in the comment may not represent the certified form of the specific color. For example, tartrazine may not be the U.S.

certified product, while FD&C Yellow No. 5 is the certified form of tartrazine.

Furthermore, the alternatives suggested in the comment have not been used in ingredient lists in the United States and are not recognized by FDA (part 74 (21 CFR part 74)) as the common or usual names of certified color additives. Accordingly, the agency is not persuaded that such names should be used at this time in place of common or usual names in the declaration of certified color additives.

However, the agency acknowledges the need, under the Free Trade Agreement, to accommodate Canadian labeling requirements where feasible. Declaration of both names for the U.S. certified color additives may facilitate familiarity with the alternative names for U.S. consumers. Therefore, manufacturers may voluntarily declare generally accepted alternative names, as suggested in the comment, in parentheses after the required U.S. name of the FDA certified color additive.

53. Another comment requested that the agency clarify that when several certified color additives are used in a food, they would have to be declared in descending order of predominance. The comment stated that proposed § 101.22(k) does not specifically address this issue. The comment was concerned that in instances where a combination of certified color additives and noncertified color additives is used in a food, the consumer would be confused because of the specific declaration of certified color additives and the use of a functional descriptor for noncertified color additives. The comment recommended that, when a combination of certified color additives and noncertified color additives is used in a food, the agency require both a functional descriptor and the listing of the specific names of all the color additives (certified and noncertified) in their order of predominance.

Declaration of certified color additives by their common or usual name must be done in a manner that complies with § 101.4. If more than one certified color additive is added to the food, the color additive present in the greatest amount must be declared first, unless the certified color additives are present at 2 percent or less and are, therefore, exempt from listing in order of predominance as provided in § 101.4(a)(2). With the exception of FD&C Yellow No. 5, current regulations have permitted collective declaration of certified and noncertified color additives, such that both "FD&C Yellow No. 5" and "artificial coloring" may appear on a food label. The agency has no evidence to indicate that consumers have been misled or confused by such a declaration. Consequently, the agency has no basis to conclude that declaration of certified and noncertified color additives as proposed would cause consumers confusion when both types of color additives are present in a food.

54. Another comment requested that FDA clarify whether dietary supplement manufacturers who comply with section 403(i) of the act, and have been permitted to list only those nutrients contained in the product for which a U.S. Recommended Daily Allowance (U.S. RDA) has been established, will be required to conform their ingredient listing to the regulation on color additives.

The agency acknowledges that a 1942 letter identified as TC–387 (Ref. 54) exempted "excipients, fillers, binders, and other fabricating ingredients" from complete ingredient declaration when used in manufacturing dietary supplements. Although TC–387 has not been officially revoked, the agency advises that its current policy, as stated in the **Federal Register** of August 2, 1973 (38 FR 20730), the **Federal Register** of March 16, 1979 (44 FR 16005), and in subsequent correspondence with industry (Refs. 55 and 56), is that the label for dietary supplements must contain a list of nutrients and a full statement of ingredients, except those exempted by section 403(i)(2) of the act, declared by the common or usual name. This policy is consistent with the ingredient declaration requirements for other types of products.

With regard to declaration of certified color additives, the 1990 amendments amended section 403(i)(2) of the act to require certified color additives be declared by their common or usual names. This requirement applies to all foods. However, in the Dietary Supplement Act of 1992, Congress imposed a moratorium on the implementation of the 1990 amendments with respect to dietary supplements with only very limited exceptions. Thus, FDA will not bring regulatory action against such products whose labels fail to declare the presence of certified color additives by their common or usual names until December 15, 1993.

55. Most comments responding to this issue strongly supported the use of abbreviated names for certified color additives. However, one comment maintained that certified color additives should be declared by their common or usual names as required in parts 74 and 82 and not by an abbreviated name unless there is a phase-in period of approximately 3 years during which both names would be used. The comment stated that this would allow consumers time to become familiar with the abbreviated name.

Because abbreviated names for certified color additives have been permitted and used by manufacturers since January 1983, the agency believes that consumers have a general understanding of these names, and are adequately informed about color additives. Consequently, an additional phase-in period is not necessary. Therefore, as proposed, the agency is providing the option to use abbreviated names for certified color additives in new § 101.22(k).

56. Several comments requested that the agency clarify the phrasing of the permitted abbreviated names. They pointed out that an FDA advisory opinion dated January 28, 1983, permitted the use of abbreviated names for color additives and the proposal of June 6, 1985 (50 FR 23815), permitted omission of not only "FD&C" but also "No." However, proposed § 101.22(k)(1) in the June 21, 1991, proposal only allowed the omission of the "FD&C" prefix from the declaration of a certified color additive in the ingredient list.

The agency acknowledges that proposed § 101.22(k)(1) in the June 21, 1991, proposal inadvertently omitted addressing the term "No." The agency intended to say that the abbreviated name need not include both "FD&C" and "No." FDA is revising new § 101.22(k)(1) accordingly.

57. The agency received several comments on the declaration of color additive lakes. Some of these comments recommended that abbreviated names should also apply to color additive lakes, so that their declaration would be consistent with that of certified color additives, e.g., "Blue 1 Lake." Other comments suggested that a single declaration (e.g., FD&C Blue No. 1) be used for both a certified color additive and its lake, or that the declaration of lakes of certified color additives follow the same requirements as certified color additives. These comments maintained that the difference between a certified color additive and its lake is one of technical functionality, and that consumers are unaware of the distinction. One comment argued that declaration of color additives and color additive lakes on the same information panel would lead to confusion and raise unnecessary questions in the consumer's mind. As an alternative, the comment recommended declaring lakes as dyes.

The agency agrees with those comments that stated that abbreviated names should also apply to certified

color additive lakes. Because this final rule provides for use of abbreviated names for certified color additives in foods, the agency finds that label declaration would be inconsistent and ultimately lead to consumer confusion if abbreviated names were not also allowed for certified color additive lakes. Accordingly, the agency is adopting, in § 101.22(k)(1), the option to declare the lake of a certified color additive using the abbreviated name of the certified color additive followed by the term "Lake." For example, a lake of FD&C Blue No. 1 would be "Blue 1 Lake."

The agency has no evidence to indicate that declaration of certified color additives and certified color additive lakes on the same information panel would lead to consumer confusion, and the comment did not present any evidence to substantiate this assertion. Furthermore, the agency believes that the use of the term "dye" for a lake would create an inappropriate distinction between a certified color additive and its lake by suggesting to consumers that certified color additive lakes are dyes, but that certified color additives are something other than dyes.

The agency is deferring rulemaking on the use of abbreviated names for color additives and lakes in drugs, cosmetics, and medical devices to separate action on the 1985 proposal.

58. One comment urged FDA to require that noncertified color additives be declared by name, so that consumers are provided with labeling information on noncertified color additives that is consistent with the labeling information on certified color additives. These comments asserted that noncertified color additives should also be declared by their common or usual names and not by collective terms, so that hypersensitive consumers can avoid foods to which they have chemical sensitivities.

Although the 1990 amendments modified section 403(i) of the act to require complete declaration of certified color additives, it did not revoke the exemption from ingredient labeling for noncertified color additives. Consequently, the agency does not have the authority to require specific declaration of noncertified color additives unless such declaration is necessary to ensure the safe use of the additive. Traditionally, the agency has encouraged manufacturers to list voluntarily, when practical, the specific names of all color additives following the functional descriptor. FDA has even provided guidance in new § 101.22(k)(2) for such a declaration.

The comment did not present any evidence to substantiate that there is a public health need for the specific declaration of all noncertified color additives. As with flavors and spices, FDA will consider requiring declaration of a noncertified color additive if such a need is demonstrated.

59. One comment stated that, although the proposal provided examples of specific declaration of noncertified color additives (e.g., caramel (color)), there appeared to be no reason to require the term "color" to be enclosed in parentheses. This comment requested clarification on whether parentheses were required, and if the term "caramel color" was an acceptable alternative.

The agency advises that the specific examples cited in the June 21, 1991, proposal for declaration of noncertified color additives were not intended to be all-inclusive. As discussed in the proposal, FDA will allow any informative term that clearly indicates to the consumer that a noncertified color additive has been added to the food. The agency advises that the term "caramel color" without parentheses adequately informs the consumer that caramel has been added to the food as a color additive.

60. Most comments generally supported FDA's recommendation, in proposed § 101.22(k)(3), for the voluntary declaration of all color additives in butter, cheese, and ice cream. These comments maintained that this practice would provide consumers with information for these three foods consistent with that now required for all other foods. No comments objected to this recommendation.

The agency is, therefore, finalizing its recommendation in new § 101.22(k) that when manufacturers add color additives to butter, cheese, or ice cream, they should voluntarily declare all color additives in the ingredient list.

61. Several comments from consumer interest groups requested that FDA require specific declaration of all flavors and spices on food labels. These comments contended that this information is important to individuals who have sensitivities to certain flavors and spices. The comments asserted that declaration of each spice and flavoring would enable these individuals to avoid foods that contain ingredients to which they are allergic.

Although the 1990 amendments required specific declaration of certified color additives, they did not amend the act to require specific declaration of flavorings or spices or of color additives that are not subject to certification. In the proposal, the agency tentatively concluded that, without such an amendment, it does not have the authority to generally require specific declaration of flavorings and spices. The comments summarized above were similar to the comments on the 1989 ANPRM that FDA reviewed when it was developing the June 21, 1991, proposal, and they did not provide any new information to justify their requests. However, if FDA determines that specific declaration of a flavor or spice is necessary to ensure its safe use, the agency will consider establishing requirements for label declaration of that flavor or spice by its common or usual name.

62. One comment requested clarification with respect to labeling of spices whose primary function is to color, e.g., paprika, a noncertified color additive. The comment argued that such an ingredient should not be labeled as a spice.

The agency encourages manufacturers to declare voluntarily specific spices and color additives they use in a food when practical. As for the label declaration of ingredients such as paprika (i.e., ingredients that have been declared GRAS as a spice and approved as a color additive), the agency expects manufacturers to declare such ingredients in a manner consistent with the ingredient's intended use in the food as provided in part 70 (21 CFR part 70). Section 70.3(f) provides that food ingredients that may contribute their own natural color when added to a food are not regarded as color additives, but when the ingredient is deliberately used as a color, it is a color additive. Therefore, if the intended use of an ingredient such as paprika is to color the food, it must be declared as an added color.

IX. Use of "And/Or" Labeling

FDA allows the use of "and/or" labeling in certain situations when manufacturers are unable to adhere to a consistent pattern of use of specific ingredients in their products (§ 101.4(b)). Such labeling provides a manufacturer with the flexibility to list together in the ingredient list of a food product all the ingredients of a particular type (e.g., fats or oils) that it sometimes uses to make the product, without having to specify the ingredients that are actually present in the product. To make clear that not all of the ingredients identified are actually present, the entry in the ingredient list must include the words "or," "and/or," or "contains one or more of the following." For example, the ingredient list on a package of crackers may include an entry, "partially

hydrogenated vegetable shortening (soybean oil, canola oil, and/or palm oil)."

In the June 21, 1991, proposal, FDA tentatively decided to continue to permit the use of "and/or" labeling for fats and oils. However, the agency requested any available scientific data on adverse reactions to fats or oils that would warrant a reconsideration of this decision.

The agency also discussed industry petitions that requested the use of "and/or" labeling of sweeteners, primarily for soft drinks (sodas) in the June 21, 1991, proposal. At that time, the agency denied the request for "and/or" labeling for sweeteners.

63. The majority of consumer comments addressing this issue opposed the continued use of "and/or" labeling for fats and oils for reasons already addressed in the June 21, 1991, proposal. These comments requested that the agency reconsider its position and revoke § 101.4(b)(14). These comments, however, did not offer any information that had not already been considered in developing the June 21, 1991, proposal.

In light of the 1990 amendments, which mandate declaration of the saturated fatty acid content of a food, and the revisions in nutrition labeling regulations proposed on November 27, 1991 (56 FR 60366), the agency does not believe that the potential benefits from requiring more specific labeling of fats and oils outweigh the possible impact of higher food costs that accrue when manufacturers are forced to change food labels in response to marketplace price fluctuations of fats and oils. In addition, the mandatory declaration of saturated fatty acid content grants the consumers' primary request regarding more information on saturated fats. Accordingly, FDA is not revoking § 101.4(b)(14).

It should be noted that § 101.4(b)(14) restricts "and/or" labeling to situations in which fats and oils are not the predominant ingredient. The agency is not changing this restriction.

64. One comment requested the option to use an "and/or" statement to list specific protein hydrolysates in canned tuna. The comment asserted that "and/or" labeling would give tuna processors the flexibility to select protein hydrolysates for use as flavor enhancers in canned tuna, based on cost considerations and the availability of these ingredients, without having to change labels.

FDA is not granting this request. Designation of the specific source of protein when protein hydrolysate is listed in the ingredient statement of the label alerts consumers to the exact identity of this ingredient. Such declaration of protein hydrolysates provides a tangible benefit to consumers who may be avoiding a particular protein source because of religious or cultural beliefs or other personal reasons. While FDA recognizes the need for flexibility in the selection of the protein hydrolysates used for flavor enhancing purposes in canned tuna, the agency believes that a provision for "and/or" labeling of the protein hydrolysate would defeat the purpose of this declaration.

As stated elsewhere in this document, FDA believes that consumers have a right to be able to choose between products on the basis of the ingredients contained in the foods. Disjunctive labeling on canned tuna, i.e., "and/or" labeling, limits consumers' choices because they must avoid all tuna products that may contain a certain protein hydrolysate when this ingredient is listed as one of several alternative protein hydrolysates on the label. Even though most protein hydrolysates used for flavor enhancement are highly hydrolyzed and unlikely to cause adverse reactions, FDA believes that manufacturers should continue to provide specific source information on protein hydrolysates to enable consumers to make choices based on their personal, cultural, or religious beliefs. Therefore, FDA is not making the requested change in the standard of identity for canned tuna.

FDA acknowledges that "and/or" labeling is used for fats and oils to provide a measure of flexibility in the selection and use of these ingredients in foods. In such cases, however, FDA notes that there is potential for cost savings which can be passed on to consumers when manufacturers have the option of selecting oils suitable for a particular food operation, based on cost and availability. This is particularly significant because food oils are used in large volumes in food production; protein hydrolysates generally are not. Moreover, no information on the magnitude of potential costs savings was presented in the comment. In addition, the use of "and/or" labeling with fats and oils is augmented by information concerning the fat, fatty acid, and cholesterol contents of the foods in nutrition labeling, thus providing further information to enable consumers to avoid foods that contain levels of cholesterol, total fat, or saturated fat that are inconsistent with their nutrition goals.

65. Comments requesting that the agency reconsider its position on the use of "and/or" labeling for sweeteners argued that, while present price relationships between sugar and corn sweeteners may be relatively constant, there is no guarantee that either sugar processing costs or the impact of the U.S. sugar program on prices will remain static. The comments further stated that advances in processing technologies may cause changes in traditional price relationships, and that manufacturers will need the flexibility of "and/or" labeling to remain competitive.

The agency acknowledges that price fluctuations between sugar and corn sweeteners may eventually occur. If and when FDA is provided evidence that significant price fluctuations occur among different sweeteners, or the flexibility of "and/or" labeling otherwise becomes necessary, the agency will consider initiating rulemaking to permit this labeling exemption.

66. Comments from the soft drink industry requested that the agency reconsider the citizen petition of the National Soft Drink Association (NSDA) (January 20, 1984—Docket No. 84P–0029) and provide for use of "and/or" labeling for sweeteners in soft drinks. The agency has reconsidered the citizen petition of the NSDA and is proposing, as discussed elsewhere in this issue of the **Federal Register**, to allow "and/or" labeling for sweeteners in soft drinks.

X. Other Labeling Issues

A. Ingredient List Format

In the June 21, 1991, proposal, the agency discussed several ways that the readability of the ingredient list might be enhanced. However, the agency was not aware of any evidence that the current ingredient labeling format was not adequate to meet the labeling requirements provided in section 403(f) of the act. Without such evidence, the agency had no basis to propose new format requirements for ingredient labeling. Hence, the agency requested that if there is a need to revise the ingredient list format, comments provide data to substantiate the need and to describe what changes would improve the label.

67. A number of comments opposed separation of ingredient declaration of major and minor ingredients and expressed concern that such a separation might lead consumers to pay less attention than is merited to those ingredients listed as minor, which may include chemicals that have a significant health effect. Some comments also expressed concern that such a requirement could result in a further division between the United

States and the European Economic Community labeling requirements and create a barrier to trade. Finally, one comment stated that proposed § 101.4(a)(2) allows the option of separate declaration for ingredients present at two percent or less when preceded by an appropriate quantifying statement. Thus, the comment saw no reason to require the separation of major and minor ingredients. On the other hand, a few comments supported separation of the ingredient statement.

The agency has considered the positions presented in all of the comments. As stated in the June 21, 1991, proposal, the agency believes that separation of the ingredient statement into major and minor ingredients, would improve readability. However, the comments supporting separation of the ingredient list did not present evidence that the current labeling format did not fully satisfy section 403(f) of the act. Thus, the agency is not requiring separation of major and minor ingredients in this final rule.

68. The comments addressing increased type size requirements on the ingredient label generally recommended that readability would be enhanced by the use of capital and lower case letters without right margin justification printed in distinct contrast to other printed or graphic matter on an appropriate background. One of the comments reported that labels with black lettering on blue background or black lettering on red background are difficult to read.

The agency allows manufacturers to print ingredient lists in capital and lower case letters. The agency has no requirements with respect to right margin justification and allows use of this format. Furthermore, the agency allows the manufacturer flexibility in choosing specific color schemes for labeling and packaging. However, the agency emphasizes that the color schemes and printing used in ingredient labeling must comply with the provisions of section 403(f) of the act, which require that the information be conspicuous and have sufficient contrast to its background as to render it likely to be read and understood by the ordinary individual under customary conditions of purchase and use. Furthermore, in § 101.2(c) with § 101.105(h), the agency requires that information appearing on the ingredient label shall appear prominently and conspicuously in easily legible boldface print or type in distinct contrast to other printed or graphic matter on the label. Thus, the agency has concluded that several of the recommendations presented in the comments are incorporated in current labeling requirements. The agency has further concluded that current labeling requirements with respect to format, except as discussed in the wax and resin section of this document, are adequate to meet the requirements of the act and, therefore, finds no basis to revise them at this time.

B. Restaurant Foods

In the June 21, 1991, proposal, the agency requested comments on the practicability and feasibility of requiring ingredient labeling of restaurant foods. In addition, the agency also requested suggestions for appropriate ingredient labeling formats for restaurant foods if such labeling were required.

69. Several comments from consumers and consumer interest groups supported full ingredient disclosure for restaurants that maintain standardized menus (e.g., chain or fast food restaurants). In support of their position, these comments argued that because standardized menu items are all prepared in the same manner, they are conducive to ingredient labeling. One comment recommended, however, that ingredient labeling for chain restaurants be done on a trial basis before instituting regulations. Another comment from a chain pizza restaurant opposed ingredient labeling for restaurants. The comment asserted that it would be impossible for restaurants to use ingredient labeling because it would: (1) Hinder work on new formulations; (2) require a standardized menu; (3) limit menu items; and (4) escalate prices. In the alternative, the comment recommended that restaurants distribute a brochure providing ingredient information for any food item that might be used in their products. The brochures would be distributed at point of purchase or available upon request through a toll-free number. This comment urged the agency not to require ingredient labeling for chain restaurants.

The agency believes that it may be feasible for certain types of restaurants (e.g., chain or fast food restaurants with standardized food preparation and ingredient specifications) to provide ingredient information. However, the agency has not received enough information about the industry to determine the appropriateness and manner of requiring ingredient labeling by restaurants. While it is not adopting requirements at this time for ingredient labeling of restaurant foods, FDA encourages such declarations on a voluntary basis.

As discussed in the June 21, 1991, proposal, the agency cannot reasonably expect restaurants that frequently change their menu items to provide information on ingredients. The agency concurs with the comment that a brochure would be helpful to consumers in providing information on ingredients used in prepared foods when it is impractical for a restaurant to provide ingredient information for all menu items. The agency encourages restaurants to provide written information regarding ingredients used in prepared foods when practical.

C. Vendor Foods

70. Several comments from the vending industry requested that the agency exempt foods sold from automatic vending machines from ingredient declaration requirements. These comments did not, however, provide information to substantiate their request that the agency had not already considered in developing the June 21, 1991, proposal.

In the absence of information not already considered by the agency, and for the reasons discussed in the proposal, FDA reaffirms its previous decision not to exempt vendor foods from full ingredient labeling requirements.

D. Warning Statements

71. One of the issues addressed in the June 21, 1991, proposal was the practicality and desirability of requiring warning statements on foods to announce the presence of specific ingredients. At that time, the agency tentatively decided not to require the broad use of warning statements with respect to ingredients.

Comments on this issue generally supported FDA's position not to require warning statements in the absence of clear evidence of a health hazard. The comments warned that an overabundance of warning statements may desensitize the general public to safety concerns and subsequently cause warning statements to lose some of their value as a means of informing the consumer about potential health hazards.

The agency affirms its tentative position and does not intend to require warning statements except in specific instances where there is scientifically based evidence of a potential health hazard.

E. Simplified Names for Ingredients

72. The agency discussed, in the June 21, 1991, proposal, the various criteria that must be met before a new simplified name for an ingredient can supplant an established name in the ingredient list. Specifically, the new

name must be descriptive of the ingredient, must not provide misleading label information, and must be shown to be recognized by consumers.

The agency did not receive any comments addressing this issue. Therefore the agency does not plan to change any of the criteria discussed in the proposal.

F. Statements of Ingredients' Functions

73. In the June 21, 1991, proposal the agency said that it would consider any suggestions for declaration of the function of a particular ingredient or group of ingredients that are supported by appropriate evidence and that can be justified under one of the relevant statutory standards (i.e., sections 409(c) and 201(n) of the act). Since the comments did not provide evidence to support the declaration of the function of a particular ingredient or group of ingredients, the agency is not adopting any new requirements to list the function or purpose of food ingredients.

G. Irradiated Ingredients

74. One comment opposed declaration of irradiated foods by their common or usual names without specific declaration of irradiation and argued that consumers should be informed about the processing of the food. The comment did not present information not already considered by the agency in developing the June 21, 1991, proposal.

As stated in the proposal, the agency addressed the issue of declaration of irradiated ingredients in the **Federal Register** of December 30, 1988 (53 FR 53176). At that time, the agency concluded that irradiated ingredients should be declared by their common or usual name without additional information on processing. The agency finds no basis on which to revise its 1988 decision.

XI. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register.** In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857, and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

XII. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in the June 21, 1991, proposal the agency determined that under 21 CFR 25.24(a)(11), this action is of a type that does not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required.

XIII. Effective Date

Several comments from the food industry strongly urged FDA to reconsider the effective date for ingredient labeling regulations for standardized foods and certified color additives. The comments argued that a November 8, 1991, effective date would not allow the food industry enough time to develop the required labeling and would significantly increase costs, because inventory would have to be discarded. These comments strongly urged FDA to establish a uniform effective date, for all proposed changes in ingredient labeling, to comply with the effective date for section 403(q) of the act (mandatory nutrition labeling) and section 403(r) (claims), which were added by the 1990 amendments.

Section 10(c) of the 1990 amendments established an effective date of November 8, 1991, for ingredient labeling of standardized foods and color additives required to be certified. However, Congress changed that effective date on August 17, 1991, and established a new effective date of May 8, 1993. In the November 27, 1991, **Federal Register** (56 FR 60877), the agency published information on this change in the effective date for standardized foods and certified color additives. As stated in that document, labels attached to food after May 8, 1993, will be subject to amended section 403(i) of the act and to this final rule. However, labels printed after July 1, 1991, but before the effective date of this final rule and applied before May 8, 1993, must comply with the June 21, 1991, proposal. Thus, the effective date of the final provisions in this regulation for standardized foods and certified color additives is May 8, 1993. The other final provisions in this regulation become effective on May 8, 1994.

List of Subjects

21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

21 CFR Part 102

Beverages, Food grades and standards, Food labeling, Frozen foods, Fruit juices, Oils and fats, Onions, Potatoes, Seafood.

21 CFR Part 130

Food additives, Food grades and standards, Incorporation by reference.

21 CFR Part 135

Food grades and standards, Food labeling, Frozen foods, Ice cream.

21 CFR Part 136

Bakery products, Food grades and standards.

21 CFR Part 137

Cereals (food), Food grades and standards.

21 CFR Part 139

Food grades and standards.

21 CFR Part 145

Food grades and standards, Fruits.

21 CFR Part 146

Food grades and standards, Fruit juices.

21 CFR Part 150

Food grades and standards, Fruits.

21 CFR Part 152

Bakery products, Food grades and standards, Frozen foods, Fruits.

21 CFR Part 155

Food grades and standards, Vegetables.

21 CFR Part 156

Food grades and standards, Vegetable juices.

21 CFR Part 158

Food grades and standards, Frozen foods, Vegetables.

21 CFR Part 160

Eggs and egg products, Food grades and standards.

21 CFR Part 161

Food grades and standards, Frozen foods, Seafood.

21 CFR Part 163

Cacao products, Food grades and standards.

21 CFR Part 164

Food grades and standards, Nuts, Peanuts.

21 CFR Part 166

Food grades and standards, Food labeling, Margarine.

21 CFR Part 168

Food grades and standards, Sugar.

21 CFR Part 169

Food grades and standards, Oils and fats, Spices and flavorings.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, FDA is amending 21 CFR parts 101, 102, 130, 135, 136, 137, 139, 145, 146, 150, 152, 155, 156, 158, 160, 161, 163, 164, 166, 168, and 169 as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.4 is amended by revising paragraphs (a)(1), and (b)(2)(i), and by adding new paragraphs (b)(20) through (b)(22), (d), (e), and (f) to read as follows:

§ 101.4 Food; designation of ingredients.

(a)(1) Ingredients required to be declared on the label or labeling of a food, including foods that comply with standards of identity, except those ingredients exempted by § 101.100, shall be listed by common or usual name in descending order of predominance by weight on either the principal display panel or the information panel in accordance with the provisions of § 101.2.

* * * * *

(b) * * *

(2) * * *

(i) By declaring the established common or usual name of the ingredient followed by a parenthetical listing of all ingredients contained therein in descending order of predominance except that, if the ingredient is a food subject to a definition and standard of identity established in subchapter B of this chapter that has specific labeling provisions for optional ingredients, optional ingredients may be declared within the parenthetical listing in accordance with those provisions.

* * * * *

(20) For purposes of ingredient labeling, the term "sugar" shall refer to sucrose, which is obtained from sugar cane or sugar beets in accordance with the provisions of § 184.1854 of this chapter.

(21) [Reserved]

(22) Wax and resin ingredients on fresh produce when such produce is held for retail sale, or when held for other than retail sale by packers or repackers shall be declared collectively by the phrase "coated with food-grade animal-based wax, to maintain freshness" or the phrase "coated with food-grade vegetable-, petroleum-, beeswax-, and/or shellac-based wax or resin, to maintain freshness" as appropriate. The terms "food-grade" and "to maintain freshness" are optional. The term "lac-resin" may be substituted for the term "shellac."

* * * * *

(d) When foods characterized on the label as "nondairy" contain a caseinate ingredient, the caseinate ingredient shall be followed by a parenthetical statement identifying its source. For example, if the manufacturer uses the term "nondairy" on a creamer that contains sodium caseinate, it shall include a parenthetical term such as "a milk derivative" after the listing of sodium caseinate in the ingredient list.

(e) If the percentage of an ingredient is included in the statement of ingredients, it shall be shown in parentheses following the name of the ingredient and expressed in terms of percent by weight. Percentage declarations shall be expressed to the nearest 1 percent, except that where ingredients are present at levels of 2 percent or less, they may be grouped together and expressed in accordance with the quantifying guidance set forth in paragraph (a)(2) of this section.

(f) Except as provided in § 101.100 ingredients that must be declared on labeling because there is no label for the food, including foods that comply with standards of identity, shall be listed prominently and conspicuously by common or usual name in the manner prescribed by paragraph (b) of this section.

§ 101.6 [Removed]

3. Section 101.6 *Label designation of ingredients for standardized foods* is removed from subpart A.

4. Section 101.22 is amended by adding new paragraphs (h)(7) and (k) to read as follows:

§ 101.22 Foods; labeling of spices, flavorings, colorings and chemical preservatives.

* * * * *

(h) * * *

(7) Because protein hydrolysates function in foods as both flavorings and flavor enhancers, no protein hydrolysate used in food for its effects on flavor may be declared simply as "flavor," "natural flavor," or "flavoring." The ingredient shall be declared by its specific common or usual name as provided in § 102.22 of this chapter.

* * * * *

(k) The label of a food to which any coloring has been added shall declare the coloring in the statement of ingredients in the manner specified in paragraphs (k)(1) and (k)(2) of this section, except that colorings added to butter, cheese, and ice cream, if declared, may be declared in the manner specified in paragraph (k)(3) of this section, and colorings added to foods subject to §§ 105.62 and 105.65 of this chapter shall be declared in accordance with the requirements of those sections.

(1) A color additive or the lake of a color additive subject to certification under 706(c) of the act shall be declared by the name of the color additive listed in the applicable regulation in part 74 or part 82 of this chapter, except that it is not necessary to include the "FD&C" prefix or the term "No." in the declaration, but the term "Lake" shall be included in the declaration of the lake of the certified color additive (e.g., Blue 1 Lake). Manufacturers may parenthetically declare an appropriate alternative name of the certified color additive following its common or usual name as specified in part 74 or part 82 of this chapter.

(2) Color additives not subject to certification may be declared as "Artificial Color," "Artificial Color Added," or "Color Added" (or by an equally informative term that makes

clear that a color additive has been used in the food). Alternatively, such color additives may be declared as "Colored with ————————" or "————————— color", the blank to be filled with the name of the color additive listed in the applicable regulation in part 73 of this chapter.

(3) When a coloring has been added to butter, cheese, or ice cream, it need not be declared in the ingredient list unless such declaration is required by a regulation in part 73 or part 74 of this chapter to ensure safe conditions of use for the color additive. Voluntary declaration of all colorings added to butter, cheese, and ice cream, however, is recommended.

§ 101.35 [Removed]

5. Section 101.35 *Notice to manufacturers and users of monosodium glutamate and other hydrolyzed vegetable protein products* is removed from subpart B.

6. Section 101.100 is amended by revising paragraph (a)(2) to read as follows:

§ 101.100 Food; exemptions from labeling.

(a) * * *

(2) A food having been received in bulk containers at a retail establishment, if displayed to the purchaser with either:

(i) The labeling of the bulk container plainly in view, provided ingredient information appears prominently and conspicuously in lettering of not less than one-fourth of an inch in height; or

(ii) A counter card, sign, or other appropriate device bearing prominently and conspicuously, but in no case with lettering of less than one-fourth of an inch in height, the information required to be stated on the label pursuant to section 403(i)(2) of the Federal Food, Drug, and Cosmetic Act (the act).

* * * * *

PART 102—COMMON OR USUAL NAME FOR NONSTANDARDIZED FOODS

7. The authority citation for 21 CFR part 102 continues to read as follows:

Authority: Secs. 201, 403, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 343, 371).

8. New § 102.22 is added to subpart B to read as follows:

§ 102.22 Protein hydrolysates.

The common or usual name of a protein hydrolysate shall be specific to the ingredient and shall include the identity of the food source from which the protein was derived.

(a) "Hydrolyzed wheat gluten," "hydrolyzed soy protein," and "autolyzed yeast extract" are examples of acceptable names. "Hydrolyzed casein" is also an example of an acceptable name, whereas "hydrolyzed milk protein" is not an acceptable name for this ingredient because it is not specific to the ingredient (hydrolysates can be prepared from other milk proteins). The names "hydrolyzed vegetable protein" and "hydrolyzed protein" are not acceptable because they do not identify the food source of the protein.

(b) [Reserved]

PART 130—FOOD STANDARDS: GENERAL

9. The authority citation for 21 CFR part 130 continues to read as follows:

Authority: Secs. 201, 306, 401, 403, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 336, 341, 343, 371).

10. Section 130.3 is amended by adding new paragraph (e) to read as follows:

§ 130.3 Definitions and interpretations.

* * * * *

(e) Section 403(i) of the act requires the listing of all ingredients in standardized foods. All ingredients must be listed in accordance with the requirements of part 101 of this chapter, except that where a definition and standard of identity has specific labeling provisions for optional ingredients, optional ingredients may be declared in accordance with those provisions.

11. New § 130.9 is added to subpart A to read as follows:

§ 130.9 Sulfites in standardized food.

(a) Any standardized food that contains a sulfiting agent or combination of sulfiting agents that is functional and provided for in the applicable standard or that is present in the finished food at a detectable level is misbranded unless the presence of the sulfiting agent or agents is declared on the label of the food. A detectable amount of sulfiting agent is 10 parts per million or more of the sulfite in the finished food. The level of sulfite in the finished food will be determined using sections 20.123 through 20.125, "Sulfurous Acid (Total) in Food Modified Monier-Williams Method Final Action" in "Official Methods of Analysis of the Association of Official Analytical Chemists," 14th ed. (1984), which is incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51, and the refinements of the "Total Sulfurous Acid" procedure in the "Monier-Williams Procedure (with Modifications) for Sulfites in Foods," which is appendix A to part 101 of this chapter. A copy of sections 20.123 through 20.125 of the "Official Methods of Analysis of the Association of Official Analytical Chemists" is available from AOAC International, 1111 North 19th St., Suite 210, Arlington, VA 22209, or available for inspection at the Office of the Federal Register, 800 North Capitol St. NW., Suite 700, Washington, DC.

(b) Any standardized food that, as a result of actions that are consistent with current good-manufacturing practice, contains an indirectly added sulfiting agent that has no functional effect in the food and that would, in the absence of § 101.100(a)(4) of this chapter, be considered to be an incidental additive for purposes of § 130.8, conforms to the applicable definition and standard of identity if the presence of the sulfiting agent is declared on the label of the food.

12. New § 130.11 is added to subpart A to read as follows:

§ 130.11 Label designations of ingredients for standardized foods.

Some definitions and standards of identity for foods set forth below require that designated optional ingredients such as spices, flavorings, colorings, emulsifiers, flavor enhancers, stabilizers, preservatives, and sweeteners be declared in a specified manner on the label wherever the name of the standardized food appears on the label so conspicuously as to be easily seen under customary conditions of purchase. Such requirements shall apply to a manufacturer, packer, or distributor of a standardized food only if the words or statements on the label of the standardized food significantly differentiate between two or more foods that comply with the same standard by describing the optional forms or varieties, the packing medium, or significant characterizing ingredients present in the food.

PART 135—FROZEN DESSERTS

13. The authority citation for 21 CFR part 135 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

14. Section 135.160 is amended by revising paragraph (a) to read as follows:

§ 135.160 Water ices.

(a) *Description.* Water ices are the foods each of which is prepared from the same ingredients and in the same manner prescribed in § 135.140 for sherbets, except that the mix need not

be pasteurized, and complies with all the provisions of § 135.140 (including the requirements for label statement of ingredients), except that no milk or milk-derived ingredient and no egg ingredient, other than egg white, is used.

* * * * *

PART 136—BAKERY PRODUCTS

15. The authority citation for 21 CFR part 136 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

16. Section 136.110 is amended by revising paragraph (f) to read as follows:

§ 136.110 Breads, rolls, and buns.

* * * * *

(f) *Label declaration.* Each of the ingredients used shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

PART 137—CEREAL FLOURS AND RELATED PRODUCTS

17. The authority citation for 21 CFR part 137 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

18. Section 137.105 is amended by revising paragraph (b)(1) to read as follows:

§ 137.105 Flour.

* * * * *

(b)(1) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

19. Section 137.155 is revised to read as follows:

§ 137.155 Bromated flour.

Bromated flour conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for flour by § 137.105, except that potassium bromate is added in a quantity not exceeding 50 parts to each million parts of the finished bromated flour, and is added only to flours whose baking qualities are improved by such addition.

20. Section 137.160 is revised to read as follows:

§ 137.160 Enriched bromated flour.

Enriched bromated flour conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for enriched flour by § 137.165, except that potassium bromate is added in a quantity not exceeding 50 parts to each million parts of the finished enriched bromated flour, and is added only to enriched flours whose baking qualities are improved by such addition.

21. Section 137.165 is amended by revising the introductory text to read as follows:

§ 137.165 Enriched flour.

Enriched flour conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for flour by § 137.105, except that:

* * * * *

22. Section 137.170 is amended by revising paragraph (a) to read as follows:

§ 137.170 Instantized flours.

(a) Instantized flours, instant blending flours, and quick-mixing flours, are the foods each of which conforms to the definition and standard of identity and is subject to the requirement for label statement of ingredients prescribed for the corresponding kind of flour by §§ 137.105, 137.155, 137.160, 137.165, 137.175, 137.180, and 137.185, except that each such flour has been made by one of the optional procedures set forth in paragraph (b) of this section, and is thereby made readily pourable. Such flours will all pass through a No. 20 mesh U.S. standard sieve (840-micron opening), and not more than 20 percent will pass through a 200 mesh U.S standard sieve (74-micron opening).

* * * * *

23. Section 137.175 is amended by revising the introductory text to read as follows:

§ 137.175 Phosphated flour.

Phosphated flour, phosphated white flour, and phosphated wheat flour, conform to the definition and standard of identity, and are subject to the requirements for label declaration of ingredients, prescribed for flour by § 137.105, except that:

* * * * *

24. Section 137.180 is amended by revising paragraph (b) to read as follows:

§ 137.180 Self-rising flour.

* * * * *

(b) Label declaration. Each of the ingredients used in the food, shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

25. Section 137.185 is amended by revising the introductory text to read as follows:

§ 137.185 Enriched self-rising flour.

Enriched self-rising flour conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for self-rising flour by § 137.180, except that:

* * * * *

26. Section 137.200 is amended by revising paragraph (b)(1) to read as follows:

§ 137.200 Whole wheat flour.

* * * * *

(b)(1) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

27. Section 137.205 is revised to read as follows:

§ 137.205 Bromated whole wheat flour.

Bromated whole wheat flour conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for whole wheat flour by § 137.200, except that potassium bromate is added in a quantity not exceeding 75 parts to each million parts of finished bromated whole wheat flour.

28. Section 137.225 is revised to read as follows:

§ 137.225 Whole durum flour.

Whole durum wheat flour conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for whole wheat flour by § 137.200, except that cleaned durum wheat, instead of cleaned wheat other than durum wheat and red durum wheat, is used in its preparation.

29. Section 137.235 is amended by adding new paragraph (c) to read as follows:

§ 137.235 Enriched corn grits.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

30. Section 137.260 is amended by adding new paragraph (c) to read as follows:

§ 137.260 Enriched corn meals.

* * * * *

(c) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

31. Section 137.270 is amended by adding new paragraph (c) to read as follows:

§ 137.270 Self-rising white corn meal.

* * * * *

(c) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

32. Section 137.305 is amended by revising paragraph (b)(1) to read as follows:

§ 137.305 Enriched farina.

* * * * *

(b)(1) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

33. Section 137.350 is amended by adding new paragraph (g) to read as follows:

§ 137.350 Enriched rice.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

PART 139—MACARONI AND NOODLE PRODUCTS

34. The authority citation for 21 CFR part 139 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

35. Section 139.110 is amended by adding new paragraph (g) to read as follows:

§ 139.110 Macaroni products.

* * * * *

(g) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

36. Section 139.115 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.115 Enriched macaroni products.

(a) Description: Enriched macaroni products are the class of food each of which conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients, prescribed for macaroni products by § 139.110(a), (f), and (g), except that:

* * * * *

37. Section 139.117 is amended by revising paragraph (e) to read as follows:

§ 139.117 Enriched macaroni products with fortified protein.

* * * * *

(e) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

38. Section 139.120 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.120 Milk macaroni products.

(a) Milk macaroni products are the class of food, each of which conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients prescribed for macaroni products by § 139.110(a), (f)(2), (f)(3), and (g), except that:

* * * * *

39. Section 139.121 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.121 Nonfat milk macaroni products.

(a) Each of the macaroni products made with nonfat milk for which a definition and standard of identity is prescribed by this section conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for macaroni products by § 139.110(a), (f)(2), (f)(3), (f)(4), and (g), except that:

* * * * *

40. Section 139.122 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.122 Enriched nonfat milk macaroni products.

(a) Each of the enriched macaroni products made with nonfat milk for which a definition and standard of identity is prescribed by this section conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for macaroni products by § 139.110(a), (f)(2), (f)(3), (f)(4), and (g), except that:

* * * * *

41. Section 139.125 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.125 Vegetable macaroni products.

(a) Vegetable macaroni products are the class of food each of which conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients prescribed for macaroni products by § 139.110(a), (f)(2), (f)(3), and (g), except that:

* * * * *

42. Section 139.135 is amended by revising paragraph (a) to read as follows:

§ 139.135 Enriched vegetable macaroni products.

(a) Each of the macaroni products for which a definition and standard of identity is prescribed by this section conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients prescribed for macaroni products by § 139.110(a), (f), and (g), and in addition is enriched to meet the requirements prescribed for enriched macaroni products by § 139.115 and contains a vegetable ingredient in compliance with the requirements prescribed for vegetable macaroni products by § 139.125.

* * * * *

43. Section 139.138 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.138 Whole wheat macaroni products.

(a) Whole wheat macaroni products are the class of food each of which conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients, prescribed for macaroni products by § 139.110(a), (f)(2), (f)(3), and (g), except that:

* * * * *

44. Section 139.140 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.140 Wheat and soy macaroni products.

(a) Wheat and soy macaroni products are the class of food each of which conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients, prescribed for macaroni products by § 139.110(a), (f)(2), (f)(3), and (g), except that:

* * * * *

45. Section 139.150 is amended by adding new paragraph (i) to read as follows:

§ 139.150 Noodle products.

* * * * *

(i) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

46. Section 139.155 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 139.155 Enriched noodle products.

(a) Enriched noodle products are the class of food each of which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for noodle products by § 139.150(a), (g), and (i), except that:

* * * * *

47. Section 139.160 is amended by revising paragraph (a) to read as follows:

§ 139.160 Vegetable noodle products.

(a) Vegetable noodle products are the class of food each of which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for noodle products by § 139.150(a), (g), and (i), except that tomato (of any red variety), artichoke, beet, carrot, parsley, or spinach is added in such quantity that the solids thereof are not less than 3 percent by weight of the finished vegetable noodle product (the vegetable used may be fresh, canned, dried, or in the form of puree or paste).

* * * * *

48. Section 139.165 is amended by revising paragraph (a) to read as follows:

§ 139.165 Enriched vegetable noodle products.

(a) Each of the noodle products for which a definition and standard of identity is prescribed by this section conforms to the definition and standard of identity and is subject to the requirements for label declaration of ingredients prescribed for noodle products by § 139.150(a), (g), (h), and (i), and in addition is enriched to meet the requirements prescribed for enriched noodle products by § 139.155 and, except as hereinafter provided, contains a vegetable ingredient in compliance with the requirements prescribed for vegetable noodle products by § 139.160. Because they are apt to impart an egg-yolk color, carrots are not used in enriched vegetable noodle products.

* * * * *

49. Section 139.180 is amended by revising paragraph (a) to read as follows:

§ 139.180 Wheat and soy noodle products.

(a) Wheat and soy noodle products are the class of food each of which conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients prescribed for noodle products by § 139.150(a), (g), and (i), except that soy flour is added in a quantity not less than 12.5 percent of the combined weight of the wheat and soy ingredients used (the soy flour used is made from heat-processed, dehulled soybeans, with or without the removal of fat therefrom).

* * * * *

PART 145—CANNED FRUITS

50. The authority citation for 21 CFR part 145 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

51. Section 145.110 is amended by revising paragraph (a)(4) to read as follows:

§ 145.110 Canned applesauce.

(a) * * *

(4) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter. However, when ascorbic acid (vitamin C) is added as provided for in paragraph (a)(2)(viii)(*b*) of this section, after the application of heat to the apples, preservative labeling requirements do not apply.

* * * * *

52. Section 145.115 is amended by revising paragraph (a)(4)(iv) to read as follows:

§ 145.115 Canned apricots.

(a) * * *

(4) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

53. Section 145.116 is amended by revising paragraph (b)(2) to read as follows:

§ 145.116 Artificially sweetened canned apricots.

* * * * *

(b) * * *

(2) The artificially sweetened food is subject to the requirements for label statement of ingredients used, as prescribed for canned apricots by § 145.115(a). If the packing medium is thickened with pectin, the label shall bear the statement "thickened with pectin". When any organic salt or acid or any mixture of two or more of these is added, the label shall bear the common or usual name of each such ingredient.

54. Section 145.120 is amended by revising paragraph (a)(5)(iv) to read as follows:

§ 145.120 Canned berries.

(a) * * *

(5) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

55. Section 145.125 is amended by revising paragraph (a)(4)(iv) to read as follows:

§ 145.125 Canned cherries.

(a) * * *

(4) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

56. Section 145.126 is amended by revising paragraph (b)(2) to read as follows:

§ 145.126 Artificially sweetened canned cherries.

* * * * *

(b) * * *

(2) The artificially sweetened food is subject to the requirements for label statement of ingredients used, as prescribed for canned cherries by § 145.125(a). If the packing medium is thickened with pectin, the label shall bear the statement "thickened with pectin". When any organic salt or acid or any mixture of two or more of these is added, the label shall bear the common or usual name of each such ingredient.

57. Section 145.130 is amended by revising paragraph (d)(4) to read as follows:

§ 145.130 Canned figs.

* * * * *

(d) * * *

(4) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

58. Section 145.131 is amended by revising paragraph (b)(2) to read as follows:

§ 145.131 Artificially sweetened canned figs.

* * * * *

(b) * * *

(2) The artificially sweetened food is subject to the requirements for label statement of ingredients used, as prescribed for canned figs by § 145.130. If the packing medium is thickened with pectin, the label shall bear the statement "thickened with pectin". When any organic salt or acid or any mixture of two or more of these is added, the label shall bear the common or usual name of each such ingredient.

59. Section 145.134 is amended by adding new paragraph (f) to read as follows:

§ 145.134 Canned preserved figs.

* * * * *

(f) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

60. Section 145.135 is amended by revising paragraph (a)(4)(iv) to read as follows:

§ 145.135 Canned fruit cocktail.

(a) * * *

(4) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

61. Section 145.136 is amended by revising paragraph (b)(2) to read as follows:

§ 145.136 Artificially sweetened canned fruit cocktail.

* * * * *

(b) * * *

(2) The artificially sweetened food is subject to the requirements for label statement of ingredients used, as prescribed for canned fruit cocktail by § 145.135(a). If the packing medium is thickened with pectin, the label shall bear the statement "thickened with pectin". When any organic salt or acid or any mixture of two or more of these is added, the label shall bear the common or usual name of each such ingredient.

62. Section 145.140 is amended by revising paragraph (d)(4) to read as follows:

§ 145.140 Canned seedless grapes.

* * * * *

(d) * * *

(4) Label declaration Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

63. Section 145.145 is amended by revising paragraph (a)(4)(iii) to read as follows:

§ 145.145 Canned grapefruit.

(a) * * *

(4) * * *

(iii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

64. Section 145.170 is amended by revising paragraph (a)(4)(iv) to read as follows:

§ 145.170 Canned peaches.

(a) * * *

(4) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

65. Section 145.171 is amended by revising paragraph (b)(2) to read as follows:

§ 145.171 Artificially sweetened canned peaches.

* * * * *

(b) * * *

(2) The artificially sweetened food is subject to the requirements for label statement of ingredients used, as prescribed for canned peaches by § 145.170(a). If the packing medium is thickened with pectin, the label shall bear the statement "thickened with pectin". When any organic salt or acid or any mixture of two or more of these is added, the label shall bear the common or usual name of each such ingredient.

66. Section 145.175 is amended by revising paragraph (a)(4)(iv) to read as follows:

§ 145.175 Canned pears.

(a) * * *

(4) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

67. Section 145.176 is amended by revising paragraph (b)(2) to read as follows:

§ 145.176 Artificially sweetened canned pears.

* * * *

(b) * * *

(2) The artificially sweetened food is subject to the requirements for label statement of ingredients used, as prescribed for canned pears by § 145.175(a). If the packing medium is thickened with pectin, the label shall bear the statement "thickened with pectin". When any organic salt or acid or any mixture of two or more of these is added, the label shall bear the common or usual name of each such ingredient.

68. Section 145.180 is amended by revising paragraph (a)(5)(iii) to read as follows:

§ 145.180 Canned pineapple.

(a) * * *

(5) * * *

(iii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

69. Section 145.181 is amended by revising paragraph (b)(2) to read as follows:

§ 145.181 Artificially sweetened canned pineapple.

* * * * *

(b) * * *

(2) The artificially sweetened food is subject to the requirements for label statement of ingredients used, as prescribed for canned pineapple by § 145.180(a). If the packing medium is thickened with pectin, the label shall bear the statement "thickened with pectin".

70. Section 145.185 is amended by revising paragraph (a)(4)(iv) to read as follows:

§ 145.185 Canned plums.

(a) * * *

(4) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

71. Section 145.190 is amended by revising paragraph (c)(4) to read as follows:

§ 145.190 Canned prunes.

* * * * *

(c) * * *

(4) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the

applicable sections of parts 101 and 130 of this chapter.

PART 146—CANNED FRUIT JUICES

72. The authority citation for 21 CFR part 146 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

73. Section 146.113 is amended by adding new paragraph (h) to read as follows:

§ 146.113 Canned fruit nectars.

* * * * *

(h) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

74. Section 146.114 is amended by revising paragraph (a)(3)(ii) to read as follows:

§ 146.114 Lemon juice.

(a) * * *

(3) * * *

(ii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

75. Section 146.120 is amended by revising paragraph (c) to read as follows:

§ 146.120 Frozen concentrate for lemonade.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

76. Section 146.121 is amended by adding new paragraph (f) to read as follows:

§ 146.121 Frozen concentrate for artificially sweetened lemonade.

* * * * *

(f) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

77. Section 146.126 is amended by revising paragraph (c) to read as follows:

§ 146.126 Frozen concentrate for colored lemonade.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

78. Section 146.132 is amended by revising paragraphs (a)(3)(iii) to read as follows:

§ 146.132 Grapefruit juice.

(a) * * *

(3) * * *

(iii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

79. Section 146.140 is amended by adding new paragraph (g) to read as follows:

§ 146.140 Pasteurized orange juice.

* * * * *

(g) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

80. Section 146.141 is amended by adding new paragraph (f) to read as follows:

§ 146.141 Canned orange juice.

* * * * *

(f) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

81. Section 146.145 is amended by adding new paragraph (f) to read as follows:

§ 146.145 Orange juice from concentrate.

* * * * *

(f) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

82. Section 146.146 is amended by adding new paragraph (g) to read as follows:

§ 146.146 Frozen concentrated orange juice.

* * * * *

(g) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

83. Section 146.148 is amended by revising paragraph (a) to read as follows:

§ 146.148 Reduced acid frozen concentrated orange juice.

(a) Reduced acid frozen concentrated orange juice is the food that complies with the requirements for composition and label declaration of ingredients prescribed for frozen concentrated orange juice by § 146.146, except that it may not contain any added sweetening ingredient. A process involving the use of anionic ion-exchange resins permitted by § 173.25 of this chapter is used to reduce the acidity of the food so that the ratio of the Brix reading to the grams of acid, expressed as anhydrous citric acid, per 100 grams of juice is not less than 21 to 1 or more than 26 to 1.

* * * * *

84. Section 146.150 is amended by revising paragraph (a) to read as follows:

§ 146.150 Canned concentrated orange juice.

(a) Canned concentrated orange juice is the food that complies with the requirements of composition, definition of dilution ratio, and labeling of ingredients prescribed for frozen concentrated orange juice by § 146.146, except that it is not frozen and it is sealed in containers and so processed by heat, either before or after sealing, so as to prevent spoilage.

* * * * *

85. Section 146.152 is amended by revising paragraph (d) to read as follows:

§ 146.152 Orange juice with preservative.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter. In addition, the name of each preservative shall be proceeded by a statement of the percent by weight of the preservative used. If the food is packed in container sizes that are less than 19 liters (5 gallons), the label shall bear a statement indicating that the food is for further manufacturing use only.

* * * * *

86. Section 146.153 is amended by revising paragraph (a) to read as follows:

§ 146.153 Concentrated orange juice for manufacturing.

(a) Concentrated orange juice for manufacturing is the food that complies with the requirements of composition and label declaration of ingredients prescribed for frozen concentrated orange juice by § 146.146, except that it is either not frozen or is less concentrated, or both, and the oranges from which the juice is obtained may deviate from the standards for maturity in that they are below the minimum Brix and Brix-acid ratio for such oranges: *Provided*, however, that the concentration of orange juice soluble solids is not less than 20° Brix.

* * * * *

87. Section 146.154 is amended by revising paragraph (d) to read as follows:

§ 146.154 Concentrated orange juice with preservative.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter. In addition, the name of each preservative shall be preceded by a statement of the percent by weight of the preservative used. If the food is packed in container sizes that are less than 19 liters (5 gallons), the label shall bear a statement indicating that the food is for further manufacturing use only.

* * * * *

88. Section 146.185 is amended by revising paragraph (a)(3) to read as follows:

§ 146.185 Pineapple juice.

(a) * * *

(3) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

89. Section 146.187 is amended by adding new paragraph (d) to read as follows:

§ 146.187 Canned prune juice.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

PART 150—FRUIT BUTTERS, JELLIES, PRESERVES, AND RELATED PRODUCTS

90. The authority citation for 21 CFR part 150 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

91. Section 150.110 is amended by revising the introductory text of paragraph (e)(1) and by removing paragraph (e)(2)(ii) and reserving it, to read as follows:

§ 150.110 Fruit butter.

* * * * *

(e)(1) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

(2) * * *

(ii) [Reserved]

92. Section 150.140 is amended by revising the introductory text of paragraph (e)(2) to read as follows:

§ 150.140 Fruit jelly.

* * * * *

(e)(2) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

93. Section 150.141 is amended by adding new paragraph (h) to read as follows:

§ 150.141 Artificially sweetened fruit jelly.

* * * * *

(h) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

94. Section 150.160 is amended by revising the introductory text of paragraph (e)(2) to read as follows:

§ 150.160 Fruit preserves and jams.

* * * * *

(e) * * *

(2) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

95. Section 150.161 is amended by adding new paragraph (h) to read as follows:

§ 150.161 Artificially sweetened fruit preserves and jams.

* * * * *

(h) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

PART 152—FRUIT PIES

96. The authority citation for 21 CFR part 152 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

97. Section 152.126 is amended by revising paragraph (a)(4)(i) to read as follows:

§ 152.126 Frozen cherry pie.

(a) * * *

(4)(i) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

PART 155—CANNED VEGETABLES

98. The authority citation for 21 CFR part 155 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

99. Section 155.120 is amended by revising paragraph (a)(5) to read as follows:

§ 155.120 Canned green beans and canned wax beans.

(a) * * *

(5) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

100. Section 155.130 is amended by revising paragraph (a)(5) to read as follows:

§ 155.130 Canned corn.

(a) * * *

(5) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

101. Section 155.131 is amended by revising paragraph (a)(1) to read as follows:

§ 155.131 Canned field corn.

(a) *Identity.* (1) Canned field corn conforms to the definition and standard of identity, and is subject to the requirements for label declaration of ingredients, prescribed for canned corn by § 155.130(a), except that the corn ingredient consists of succulent field corn or a mixture of succulent field corn and succulent sweet corn.

* * * * *

102. Section 155.170 is amended by revising paragraph (a)(4) to read as follows:

§ 155.170 Canned peas.

(a) * * *

(4) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

103. Section 155.172 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 155.172 Canned dry peas.

(a) *Identity.* Canned dry peas conforms to the definition and standard of identity, and is subject to the requirements for label declaration of ingredients, prescribed for canned peas by § 155.170(a), except that:

* * * * *

104. Section 155.191 is amended by revising paragraph (a)(3)(iv) to read as follows:

§ 155.191 Tomato concentrates.

(a) * * *

(3) * * *

(iv) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

105. Section 155.194 is amended by revising paragraph (a)(3)(iii) to read as follows:

§ 155.194 Catsup.

(a) * * *

(3) * * *

(iii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter; except that the name "tomato concentrate" may be used in lieu of the names "tomato puree," "tomato pulp," or "tomato paste" and when tomato concentrates are used, the labeling requirements of § 155.191(a)(3)(ii)(*a*) and (a)(3)(ii)(*b*) do not apply.

* * * * *

106. Section 155.200 is amended by revising paragraph (h) to read as follows:

§ 155.200 Certain other canned vegetables.

* * * * *

(h) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

107. Section 155.201 is amended by revising paragraph (a)(4)(ii) to read as follows:

§ 155.201 Canned mushrooms.

(a) * * *

(4) * * *

(ii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

PART 156—VEGETABLE JUICES

108. The authority citation for 21 CFR part 156 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371).

109. Section 156.145 is amended by revising paragraph (a)(2)(ii) to read as follows:

§ 156.145 Tomato juice.

(a) * * *

(2) * * *

(ii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

PART 158—FROZEN VEGETABLES

110. The authority citation for 21 CFR part 158 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371).

111. Section 158.170 is amended by revising paragraph (a)(4) to read as follows:

§ 158.170 Frozen peas.

(a) * * *

(4) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

PART 160—EGGS AND EGG PRODUCTS

112. The authority citation for 21 CFR part 160 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

113. Section 160.105 is amended by adding new paragraph (e) to read as follows:

§ 160.105 Dried eggs.

* * * * *

(e) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

114. Section 160.110 is amended by adding new paragraph (d) to read as follows:

§ 160.110 Frozen eggs.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

115. Section 160.115 is amended by redesignating the existing text as paragraph (a) and by adding new paragraph (b) to read as follows:

§ 160.115 Liquid eggs.

* * * * *

(b) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

116. Section 160.140 is amended by adding new paragraph (c) to read as follows:

§ 160.140 Egg whites.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

117. Section 160.145 is amended by adding new paragraph (f) to read as follows:

§ 160.145 Dried egg whites.

* * * * *

(f) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

118. Section 160.150 is amended by adding new paragraph (c) to read as follows:

§ 160.150 Frozen egg whites.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

119. Section 160.180 is amended by redesignating the existing text as paragraph (a) and by adding new paragraph (b) to read as follows:

§ 160.180 Egg yolks.

* * * * *

(b) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

120. Section 160.185 is amended by adding new paragraph (e) to read as follows:

§ 160.185 Dried egg yolks.

* * * * *

(e) Label declaration. Each of the ingredients used in the food shall be

declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

121. Section 160.190 is amended by redesignating the existing text as paragraph (a) and by adding new paragraph (b) to read as follows:

§ 160.190 Frozen egg yolks.

* * * * *

(b) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

PART 161—FISH AND SHELLFISH

122. The authority citation for 21 CFR part 161 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

123. Section 161.145 is amended by adding new paragraph (a)(4) to read as follows:

§ 161.145 Canned oysters.

(a) * * *

(4) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

124. Section 161.170 is amended by revising paragraph (a)(5)(iii) to read as follows:

§ 161.170 Canned Pacific salmon.

(a) * * *

(5) * * *

(iii) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

125. Section 161.173 is amended by revising paragraph (a)(5)(ix) to read as follows:

§ 161.173 Canned wet pack shrimp in transparent or nontransparent containers.

(a) * * *

(5) * * *

(ix) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

126. Section 161.175 is amended by adding new paragraph (i) to read as follows:

§ 161.175 Frozen raw breaded shrimp.

* * * * *

(i) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

127. Section 161.190 is amended by revising paragraphs (a)(6)(ii) through (a)(6)(viii), by removing paragraph (a)(6)(ix), and by revising paragraph (a)(8)(vi) to read as follows:

§ 161.190 Canned tuna.

(a) * * *

(6) * * *

(ii) Monosodium glutamate.

(iii) Hydrolyzed protein declared in accordance with the applicable provisions of § 101.22.

(iv) Spices or spice oils or spice extracts.

(v) Vegetable broth in an amount not in excess of 5 percent of the volume capacity of the container, such broth to consist of a minimum of 0.5 percent by weight of vegetable extractives and to be prepared from two or more of the following vegetables: Beans, cabbage, carrots, celery, garlic, onions, parsley, peas, potatoes, green bell peppers, red bell peppers, spinach, and tomatoes.

(vi) Garlic.

(vii) Lemon flavoring to be prepared from lemon oil and citric acid together with safe and suitable carriers for the lemon oil which are present at nonfunctional and insignificant levels in the finished canned food. When lemon flavoring is added, a safe and suitable solubilizing and dispersing ingredient may be added in a quantity not exceeding 0.005 percent by weight of the finished food. A substance used in accordance with this paragraph is deemed to be suitable if it is used in an amount no greater than necessary to achieve the intended flavor effect, and is deemed to be safe if it is not a food additive as defined in section 201(s) of the Federal Food, Drug, and Cosmetic Act (the act), or if it is a food additive as so defined, it is used in conformity with regulations established pursuant to section 409 of the act.

(viii) Edible vegetable oil or partially hydrogenated vegetable oil, excluding olive oil, used alone or in combination in an amount not to exceed 5 percent of the volume capacity of the container, with or without any suitable form of emulsifying and suspending ingredients that has been affirmed as GRAS or approved as a food additive to aid in dispersion of the oil, as seasoning in canned tuna packed in water.

* * * * *

(8) * * *

(vi) Where the canned tuna contains one or more of the ingredients provided for in paragraph (a)(6) of this section, the label shall bear the statement "Seasoned with ————————", the blank being filled in with the name or names of the ingredient or ingredients used, except that if the ingredient designated in paragraph (a)(6)(v) of this section is used, the blank shall be filled in with the term "vegetable broth", and if the ingredients designated in paragraph (a)(6)(viii) of this section are used, the blank may be filled in with the term "oil", and if the ingredient designated in paragraph (a)(6)(iv) of this section is used alone, the label may alternatively bear either the statement "spiced" or the statement "with added spice"; and if salt is the only seasoning ingredient used, the label may alternatively bear any of the statements "salted", "with added salt", or "salt added". If the flavoring ingredients designated in paragraph (a)(6)(vii) of this section are used, the words "lemon flavored" or "with lemon flavoring" shall appear as part of the name on the label; for example, "lemon flavored chunk light tuna". Citric acid and any optional solubilizing and dispersing agent used as specified in paragraph (a)(6)(vii) of this section in connection with lemon flavoring ingredients or emulsifying and suspending ingredients used as specified in paragraph (a)(6)(viii) of this section shall be designated on the label by their common or usual name.

* * * * *

PART 163—CACAO PRODUCTS

128. The authority citation for 21 CFR part 163 continues to read as follows:

Authority: Secs. 201, 301, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 341, 343, 348, 371, 376).

129. Section 163.110 is amended by adding new paragraph (c) to read as follows:

§ 163.110 Cacao nibs.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

130. Section 163.111 is amended by adding new paragraph (c) to read as follows:

§ 163.111 Chocolate liquor.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

131. Section 163.112 is amended by adding new paragraph (c) to read as follows:

§ 163.112 Breakfast cocoa.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

132. Section 163.113 is revised to read as follows:

§ 163.113 Cocoa.

Cocoa, medium fat cocoa conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for breakfast cocoa by § 163.112, except that it contains less than 22 percent but not less than 10 percent of cacao fat as determined by the method referred to in § 163.112(a).

133. Section 163.114 is revised to read as follows:

§ 163.114 Lowfat cocoa.

Lowfat cocoa conforms to the definition and standard of identity, and is subject to the requirements for label declaration of ingredients for breakfast cocoa in § 163.112, except that the cacao fat content is less than 10 percent by weight, as determined by the method prescribed in § 163.112(a).

134. Section 163.117 is amended by revising paragraph (a) to read as follows:

§ 163.117 Cocoa with dioctyl sodium sulfosuccinate for manufacturing.

(a) Description. Cocoa with dioctyl sodium sulfosuccinate for manufacturing is the food additive complying with the provisions in § 172.520 of this chapter. It conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, for breakfast cocoa in § 163.112, or for cocoa in § 163.113, or for lowfat cocoa in § 163.114, except that the food additive contains dioctyl sodium sulfosuccinate (complying with the requirements of § 172.810 of this chapter, including the limit of not more than 0.4 percent by weight of the finished food additive).

* * * * *

135. Section 163.123 is amended by adding new paragraph (i) to read as follows:

§ 163.123 Sweet chocolate.

* * * * *

(i) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

136. Section 163.130 is amended by adding new paragraph (f) to read as follows:

§ 163.130 Milk chocolate.

* * * * *

(f) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

137. Section 163.135 is amended by adding new paregraph (c) to read as follows:

§ 163.135 Buttermilk chocolate.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

138. Section 163.140 is amended by adding new paragraph (c) to read as follows:

§ 163.140 Skim milk chocolate.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

139. Section 163.145 is amended by adding new paragraph (c) to read as follows:

§ 163.145 Mixed dairy product chocolates.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

140. Section 163.150 is amended by adding new paragraph (d) to read as follows:

§ 163.150 Sweet cocoa and vegetable fat (other than cacao fat) coating.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

141. Section 163.153 is amended by adding new paragraph (c) to read as follows:

§ 163.153 Sweet chocolate and vegetable fat (other than cacao fat) coating.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

142. Section 163.155 is amended by adding new paragraph (c) to read as follows:

§ 163.155 Milk chocolate and vegetable fat (other than cacao fat) coating.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by applicable sections of parts 101 and 130 of this chapter.

PART 164—TREE NUT AND PEANUT PRODUCTS

143. The authority citation for 21 CFR part 164 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

144. Section 164.110 is amended by revising the introductory text of paragraph (e), by removing paragraphs (e)(3) and (e)(4), and by revising paragraph (f) to read as follows:

§ 164.110 Mixed nuts.

* * * * *

(e) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

(f) The words and statements specified in paragraph (e) of this section showing the ingredients present shall be listed on the principal display panel or panels or any appropriate information panel without obscuring design, vignettes, or crowding. The declaration shall appear in conspicuous and easily legible letters of boldface print or type the size of which shall be not less than one-half of that required by part 101 of this chapter for the statement of net quantity of contents appearing on the label, but in no case less than one-sixteenth of an inch in height. The entire ingredient statement shall appear on at least one panel of the label. If the label bears any pictorial representation of the mixture of nuts, it shall depict the relative proportions of the nut ingredients of the food. If the label bears a pictorial representation of only one of each nut ingredient present, the nuts shall be depicted in the order of decreasing predominance by weight. A factual statement that the food does not contain a particular nut ingredient or ingredients may be shown on the label if the statement is not misleading and does not result in an insufficiency of label space for the proper declaration of information required by or under

authority of the act to appear on the label.

145. Section 164.150 is amended by revising paragraph (e) to read as follows:

§ 164.150 Peanut butter.

* * * * *

(e) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

PART 166—MARGARINE

146. The authority citation for 21 CFR part 166 continues to read as follows:

Authority: Secs. 201, 401, 403, 407, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 347, 348, 371, 376).

147. Section 166.110 is amended by revising paragraph (d) to read as follows:

§ 166.110 Margarine.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter. For the purposes of this section the use of the term "milk" unqualified means milk from cows. If any milk other than cow's milk is used in whole or in part, the animal source shall be identified in conjunction with the word milk in the ingredient statement. Colored margarine shall be subject to the provisions of section 407 of the Federal Food, Drug, and Cosmetic Act as amended.

PART 168—SWEETENERS AND TABLE SIRUPS

148. The authority citation for 21 CFR part 168 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

149. Section 168.110 is amended by revising paragraph (b) to read as follows:

§ 168.110 Dextrose anhydrous.

* * * * *

(b) The name of the food is "Dextrose anhydrous" or "Anhydrous dextrose" or alternatively, "———— sugar anhydrous" or "Anhydrous sugar", with the blank to be filled with the name of the food source, for example, "Corn sugar anhydrous".

150. Section 168.111 is amended by revising paragraph (c) to read as follows:

§ 168.111 Dextrose monohydrate.

* * * * *

(c) The name of the food is "Dextrose monohydrate" or "Dextrose" or alternatively, "———— sugar monohydrate" or "———— sugar", with the blank to be filled with the name of the food source, for example, "Corn sugar monohydrate" or "Corn sugar".

* * * * *

151. Section 168.130 is amended by revising paragraph (d) to read as follows:

§ 168.130 Cane sirup.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

152. Section 168.160 is amended by revising paragraph (d) to read as follows:

§ 168.160 Sorghum sirup.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

153. Section 168.180 is amended by revising paragraph (d)(1) to read as follows:

§ 168.180 Table sirup.

* * * * *

(d)(1) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

* * * * *

PART 169—FOOD DRESSINGS AND FLAVORINGS

154. The authority citation for 21 CFR part 169 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

155. Section 169.115 is amended by revising paragraph (e) to read as follows:

§ 169.115 French dressing.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

156. Section 169.140 is amended by revising paragraph (f) to read as follows:

§ 169.140 Mayonnaise.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

157. Section 169.150 is amended by revising paragraph (g) to read as follows:

§ 169.150 Salad dressing.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

158. Section 169.175 is amended by adding new paragraph (c) to read as follows:

§ 169.175 Vanilla extract.

* * * * *

(c) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

159. Section 169.176 is amended by revising paragraph (a) to read as follows:

§ 169.176 Concentrated vanilla extract.

(a) Concentrated vanilla extract conforms to the definition and standard of identity and is subject to any requirement for label statement of ingredients prescribed for vanilla extract by § 169.175, except that it is concentrated to remove part of the solvent, and each gallon contains two or more units of vanilla constituent as defined in § 169.3(c). The content of ethyl alcohol is not less than 35 percent by volume.

* * * * *

160. Section 169.177 is amended by revising paragraph (a) to read as follows:

§ 169.177 Vanilla flavoring.

(a) Vanilla flavoring conforms to the definition and standard of identity and is subject to any requirement for label statement of ingredients prescribed for vanilla extract by § 169.175, except that its content of ethyl alcohol is less than 35 percent by volume.

* * * * *

161. Section 169.178 is amended by revising paragraph (a) to read as follows:

§ 169.178 Concentrated vanilla flavoring.

(a) Concentrated vanilla flavoring conforms to the definition and standard of identity and is subject to any requirement for label statement of ingredients prescribed for vanilla flavoring by § 169.177, except that it is concentrated to remove part of the solvent, and each gallon contains two or more units of vanilla constituent as defined in § 169.3(c).

* * * * *

162. Section 169.179 is amended by adding new paragraph (d) to read as follows:

§ 169.179 Vanilla powder.

* * * * *

(d) Label declaration. Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

163. Section 169.180 is amended by revising paragraph (a) to read as follows:

§ 169.180 Vanilla-vanillin extract.

(a) Vanilla-vanillin extract conforms to the definition and standard of identity and is subject to any requirement for label statement of ingredients prescribed for vanilla extract by § 169.175, except that for each unit of vanilla constituent, as defined in § 169.3(c), contained therein, the article also contains not more than 1 ounce of added vanillin.

* * * * *

164. Section 169.181 is amended by revising paragraph (a) to read as follows:

§ 169.181 Vanilla-vanillin flavoring.

(a) Vanilla-vanillin flavoring conforms to the definition and standard of identity and is subject to any requirement for label statement of ingredients prescribed for vanilla-vanillin extract by § 169.180, except that its content of ethyl alcohol is less than 35 percent by volume.

* * * * *

165. Section 169.182 is amended by revising paragraph (a) to read as follows:

§ 169.182 Vanilla-vanillin powder.

(a) Vanilla-vanillin powder conforms to the definition and standard of identity and is subject to any requirement for label statement of ingredients prescribed for vanilla powder by § 169.179, except that for each unit of vanilla constituent as defined in § 169.3(c) contained therein, the article also contains not more than 1 ounce of added vanillin.

BILLING CODE 4160-01-F

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Parts 131, 133, 135, and 168

[Docket No. 90N-361D]

RIN 0905-AD08

Food Labeling; Declaration of Ingredients for Dairy Products and Maple Sirup

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA), in accordance with the Nutrition Labeling and Education Act of 1990 (Pub. L. 101-535) (the 1990 amendments) is amending the U.S. standards of identity for dairy products (parts 131, 133, and 135 (21 CFR parts 131, 133, and 135)) and maple sirup (21 CFR 168.140) to require the listing of the common or usual names of all ingredients in these standardized foods.

Section 701(e) of the Federal Food, Drug, and Cosmetic Act (the act) (21 U.S.C. 371(e)), as amended by the 1990 amendments, requires formal rulemaking for the amendment or repeal of standards of identity for dairy products and maple sirup. The 1990 amendments removed food standards rulemaking for all other foods from the coverage of section 701(e) of the act. Because of the procedural differences between amending the standards for dairy products and maple sirup and amending other food standards, the agency is publishing two separate final rules amending food standards. This final rule on dairy products and maple sirup is issued under formal rulemaking procedures. A companion document for other foods is published elsewhere in this issue of the Federal Register.

DATES: Effective May 8, 1993, except as to any provisions that may be stayed by the filing of proper objections; compliance may begin January 6, 1993, written objections and requests for a hearing by February 5, 1993.

ADDRESSES: Written objections may be sent to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1-23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Michelle A. Smith, Center for Food Safety and Applied Nutrition (HFS-158), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202-205-5106.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of June 21, 1991 (56 FR 28592), FDA published a proposed rule concerning the declaration of ingredients (hereinafter referred to as the June 21, 1991, proposal) and solicited public comment on ingredient labeling issues. The June 21, 1991, proposal addressed several current requirements that bear on ingredient labeling. Most significantly, section 403(i) of the act (21 U.S.C. 343(i)) requires, with certain specific exceptions, that ingredients be listed by their common or usual names on food labels. Before the 1990 amendments, the act provided FDA with authority under section 403(g) of the act to require the declaration of optional ingredients in standardized foods, but mandatory ingredients were exempt from such a requirement under section 403(i) of the act. In the absence of statutory authority, FDA could not require the complete listing of all ingredients in standardized foods. However, the 1990 amendments removed the portion of section 403(i) of the act that excluded mandatory ingredients used in standardized foods from the requirement for label declaration.

In the June 21, 1991, proposal, the agency proposed revisions of § 101.4(a)(1) and (b)(2)(i) (21 CFR 101.4(a)(1) and (b)(2)(i)) and proposed to adopt new § 130.3(e) (21 CFR 130.3(e)) to implement the new ingredient listing requirements for standardized foods prescribed by amended section 403(i) of the act. Proposed § 130.3(e) provides that all mandatory and optional ingredients of standardized foods must appear on food labels in accordance with the requirements of part 101 (21 CFR part 101), except where a definition and standard of identity contains a specific provision with respect to the declaration of optional ingredients. In addition, the agency proposed to amend specific standards of identity either by changing the existing language for label declaration of ingredients or by adding a new paragraph, to require that all ingredients be declared on the label in accordance with the applicable sections of parts 101 and 130 (21 CFR part 130).

The agency notes that several standards of identity define foods by cross-referencing other standardized foods. For example, § 133.114 *Cheddar cheese for manufacturing* describes a food that, with certain exceptions, "conforms to the definition and standard of identity prescribed for cheddar cheese by § 133.113." Similar language is contained in § § 133.109, 133.119, 133.137, 133.145, 133.157, 133.161, and 133.196. FDA advises that conformance with a cross-referenced definition and standard of identity includes compliance with the labeling provisions in the referenced standard. Thus, except where existing standards contained language contrary to the ingredient labeling requirements prescribed by amended section 403(i) of the act, it was not necessary for the June 21, 1991, proposal to change the wording of standards of identity that define foods by cross-reference. These standards are being amended by modifying the standards they cross-reference.

The 1990 amendments removed food standards rulemakings, except for actions for the amendment or repeal of food standards for dairy products or maple sirup, from the coverage of section 701(e) of the act. Section 701(e) of the act establishes formal rulemaking procedures that must be followed for the issuance, amendment, or repeal of regulations under certain sections of the act. Under formal rulemaking procedures, there is an opportunity to object to any final rule and to request a public hearing upon such objection. Such an opportunity is not provided as part of the notice and comment rulemaking procedures followed by the agency under section 701(a) of the act.

Because of the procedural differences between amending the standards for dairy products and maple sirup and amending other food standards, the agency is publishing two separate final rules. This final rule, issued under formal rulemaking procedures, amends the requirements for label declaration of ingredients in the standards of identity for dairy products (parts 131, 133, and 135) and for maple sirup (§ 168.140). A companion document amending declaration of ingredient regulations in part 101, establishing ingredient labeling requirements in part 102 (21 CFR part 102) and part 130 for nonstandardized and standardized foods, respectively, and amending the labeling requirements for standardized foods under the provisions of section 701(a) of the act appears elsewhere in this issue of the Federal Register. In addition, elsewhere in this issue of the Federal Register, FDA is publishing a proposal on other ingredient labeling issues that arose from the June 21, 1991, proposal.

The 1990 amendments gave the Secretary the authority to extend the applicability of certain of its provisions. However, the provision of the amendments that established a requirement that all ingredients in standardized foods be listed on the label is not among those provisions for which

an extension is permitted. Thus, this new labeling requirement is effective May 8, 1993.

II. Comments and Agency Response

In response to the June 21, 1991, proposal, the agency received over 700 letters containing one or more comments from a wide range of sources, including consumers, consumer organizations, professional associations, government agencies, industry, and industry trade associations. None of the comments specifically addressed ingredient labeling of maple sirup or dairy products. In addition, many comments were not relevant to these foods. However, a few of the comments, and of the agency's conclusions on the issues raised by the comments, bear generally on dairy product and maple sirup standards. A summary of comments and the agency's responses follow. The comments are discussed in more detail in the companion document on declaration of ingredients published elsewhere in this issue of the **Federal Register**.

A. Declaration of Mandatory Ingredients in Standardized Foods

The majority of comments from consumers and the food industry generally supported the declaration of mandatory as well as optional ingredients in foods in the ingredient list. In support of their position, consumers asserted that they had a right, and in many cases a need, to know the identity of all of the ingredients in the food they consume. Moreover, some comments expressed the belief that the average consumer has no idea of what mandatory ingredients go into a standardized food and, therefore, is unable to make informed decisions.

The agency agrees with these comments. FDA is amending its ingredient labeling regulations to require that all mandatory and optional ingredients of standardized foods appear on food labels in accordance with the requirements of part 101, except where a definition and standard of identity contains a specific provision with respect to the declaration of optional ingredients. In such instances, certain ingredients may be declared in accordance with that provision. Accordingly, FDA is codifying this requirement, as proposed, in new § 130.3(e). (New § 130.3(e) is being issued as part of the general final rule on declaration of ingredients, published elsewhere in this issue of the **Federal Register**.) The exceptions for certain ingredients in specified standards of identity permit continued use of alternatives to the labeling requirements of part 101 where compliance with those requirements would be impracticable.

In the June 21, 1991, proposal, the agency proposed revisions of § 101.4(a)(1) and (b)(2)(i) to reflect the new ingredient listing requirements in amended section 403(i) of the act. The proposed revisions clarify that: (1) All standardized foods must comply with § 101.4, rather than only those foods specifically required to do so by the standards; and (2) a standardized food is subject to the same treatment as any other food, except that, where the food is subject to a standard that makes specific provisions for the labeling of optional ingredients, the optional ingredients may be declared in accordance with those provisions. The agency did not receive any comments objecting to these changes. Therefore, FDA is finalizing these revisions as proposed. (New § 101.4(a)(1) and (b)(2)(i) are being issued as part of the general final rule on declaration of ingredients, published elsewhere in this issue of the **Federal Register**.)

The agency is also amending the dairy product and maple sirup standards of identity, as proposed, to require that all ingredients be declared on the label in accordance with the applicable sections of parts 101 and 130. Many of the standards already provide for declaration of all optional ingredients used in accordance with the applicable sections of part 101, and the wording in these standards has been amended to require the declaration of all ingredients. Where there is no existing provision for ingredient labeling, FDA has added a paragraph to the standard to include the new labeling provisions.

As proposed, FDA is retaining a number of existing optional ingredient listing provisions in the dairy standards that permit collective terms to be used rather than specific ingredient names where similar provisions are not present in part 101. Thus, the agency is retaining the provisions for listing the term "enzymes" rather than the specific name of the enzyme and the terms "milkfat and nonfat milk" or "nonfat milk and milkfat" for dairy ingredients in standards such as § § 133.106 *Blue cheese*, 133.133 *Cream cheese*, and 133.164 *Nuworld cheese*.

B. Labeling Exemptions

As discussed in the June 21, 1991, proposal (56 FR 28592 at 28593), part 101 provides for a number of labeling exemptions. The agency does not believe that these exemptions need to be duplicated in individual standards. For instance, several of the dairy standards in part 133 contain exemptions that provide for the declaration of the use of bacterial cultures on the label by the word "cultured" followed by the name of the substrate, e.g., "cultured cream" or "made from cultured skim milk." Other cheese standards provide for the use of terms such as "cream" for plastic cream and dried cream, "milk" for concentrated milk and dried milk, "skim milk" for concentrated skim milk and nonfat dry milk, and "whey" for cheese whey, concentrated cheese whey, and dried cheese whey. Section 101.4(b) currently provides for these labeling exemptions, and FDA concludes that the language does not need to be repeated in each standard of identity. To do so would only add needlessly repetitive language to the standards. In proposing to update the language of the standards in part 133 to require the listing of the common or usual name of all ingredients, these provisions were deleted from several of the proposed standards. There were no objections to this change. Accordingly, FDA is deleting these provisions as proposed.

III. Economic Impact

In accordance with the Regulatory Flexibility Act (Pub. L. 96–354) (5 U.S.C. 601), FDA has reviewed the final rule to amend the standards of identity for dairy products and maple sirup to determine its impact on small entities, including small businesses. The amendments will require label declaration of ingredients used in these foods in accordance with the ingredient labeling requirements of parts 101 and 130. FDA has determined that because the effect of the amendments is to require declaration of mandatory ingredients primarily (as most optional ingredients are already required to be declared on labels), and because most manufacturers already declare all ingredients on labels of these products, this action will not result in a significant impact on a substantial number of small entities. FDA has not received any new information or comments that would alter this determination. Therefore, in accordance with section 605(b) of the Regulatory Flexibility Act, FDA certifies that no significant impact on a substantial number of small entities will derive from this action.

In accordance with Executive Order 12291, FDA has carefully analyzed the economic effects of this final rule, and the agency has determined that the rule, if promulgated, will not be a major rule as defined by that order.

IV. Objections

Any person who will be adversely affected by this regulation may at any time on or before February 5, 1993, file with the Dockets Management Branch (address above) written objections thereto. Each objection shall be separately numbered, and each numbered objection shall specify with particularity the provisions of the regulation to which objection is made and the grounds for the objection. Each numbered objection on which a hearing is requested shall specifically so state. Failure to request a hearing for any particular objection shall constitute a waiver of the right to a hearing on that objection. Each numbered objection for which a hearing is requested shall include a detailed description and analysis of the specific factual information intended to be presented in support of the objection in the event that a hearing is held. Failure to include such a description and analysis for any particular objection shall constitute a waiver of the right to a hearing on the objection. Three copies of all documents shall be submitted and shall be identified with the docket number found in brackets in the heading of this document. Any objections received in response to the regulation may be seen in the Dockets Management Branch between 9 a.m. and 4 p.m., Monday through Friday.

FDA will publish notice of the objections that the agency has received or lack thereof in the **Federal Register**.

List of Subjects

21 CFR Part 131

Cream, Food grades and standards, Milk, Yogurt.

21 CFR Part 133

Cheese, Food grades and standards, Food labeling.

21 CFR Part 135

Food grades and standards, Food labeling, Frozen foods, Ice cream.

21 CFR Part 168

Food grades and standards, Sugar.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR parts 131, 133, 135, and 168 are amended as follows:

PART 131—MILK AND CREAM

1. The authority citation for 21 CFR part 131 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

2. Section 131.110 is amended by revising paragraph (f) to read as follows:

§ 131.110 Milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

3. Section 131.111 is amended by revising paragraph (h) to read as follows:

§ 131.111 Acidified milk.

* * * * *

(h) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

4. Section 131.112 is amended by revising paragraph (g) to read as follows:

§131.112 Cultured milk.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

5. Section 131.115 is amended by revising paragraph (f) to read as follows:

§ 131.115 Concentrated milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

6. Section 131.120 is amended by revising paragraph (e) to read as follows:

§ 131.120 Sweetened condensed milk.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

7. Section 131.122 is amended by revising paragraph (e) to read as follows:

§ 131.122 Sweetened condensed skimmed milk.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

8. Section 131.123 is amended by revising paragraph (f) to read as follows:

§ 131.123 Lowfat dry milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

9. Section 131.125 is amended by revising paragraph (e) to read as follows:

§ 131.125 Nonfat dry milk.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

10. Section 131.127 is amended by revising paragraph (f) to read as follows:

§ 131.127 Nonfat dry milk fortified with vitamins A and D.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

11. Section 131.130 is amended by revising paragraph (f) to read as follows:

§ 131.130 Evaporated milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

12. Section 131.132 is amended by revising paragraph (f) to read as follows:

§ 131.132 Evaporated skimmed milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

13. Section 131.135 is amended by revising paragraph (f) to read as follows:

§ 131.135 Lowfat milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

14. Section 131.136 is amended by revising paragraph (h) to read as follows:

§ 131.136 Acidified lowfat milk.

* * * * *

(h) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

15. Section 131.138 is amended by revising paragraph (g) to read as follows:

§ 131.138 Cultured lowfat milk.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

16. Section 131.143 is amended by revising paragraph (f) to read as follows:

§ 131.143 Skim milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

17. Section 131.144 is amended by revising paragraph (h) to read as follows:

§ 131.144 Acidified skim milk.

* * * * *

(h) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

18. Section 131.146 is amended by revising paragraph (g) to read as follows:

§ 131.146 Cultured skim milk.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

19. Section 131.147 is amended by revising paragraph (f) to read as follows:

§ 131.147 Dry whole milk.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

20. Section 131.149 is amended by revising paragraph (e) to read as follows:

§ 131.149 Dry cream.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

21. Section 131.150 is amended by revising paragraph (e) to read as follows:

§ 131.150 Heavy cream.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

22. Section 131.155 is amended by revising paragraph (e) to read as follows:

§ 131.155 Light cream.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

23. Section 131.157 is amended by revising paragraph (e) to read as follows:

§ 131.157 Light whipping cream.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

24. Section 131.160 is amended by revising paragraph (e) to read as follows:

§ 131.160 Sour cream.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

25. Section 131.162 is amended by revising paragraph (e) to read as follows:

§ 131.162 Acidified sour cream.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

26. Section 131.170 is amended by revising paragraph (h) to read as follows:

§ 131.170 Eggnog.

* * * * *

(h) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

27. Section 131.180 is amended by revising paragraph (e) to read as follows:

§ 131.180 Half-and-half.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

28. Section 131.185 is amended by revising paragraph (e) to read as follows:

§ 131.185 Sour half-and-half.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

29. Section 131.187 is amended by revising paragraph (e) to read as follows:

§ 131.187 Acidified sour half-and-half.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

30. Section 131.200 is amended by revising paragraph (g) to read as follows:

§ 131.200 Yogurt.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

31. Section 131.203 is amended by revising paragraph (g) to read as follows:

§ 131.203 Lowfat yogurt.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

32. Section 131.206 is amended by revising paragraph (g) to read as follows:

§ 131.206 Nonfat yogurt.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

PART 133—CHEESES AND RELATED CHEESE PRODUCTS

33. The authority citation for 21 CFR part 133 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

34. Section 133.102 is amended by revising paragraph (e) to read as follows:

§ 133.102 Asiago fresh and asiago soft cheese.

* * * * *

(e) Label declaration: Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that enzymes of animal, plant, or microbial origin may be declared as "enzymes".

35. Section 133.103 is revised to read as follows:

§ 133.103 Asiago medium cheese.

Asiago medium cheese conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients prescribed by § 133.102 for asiago fresh cheese, except that it contains not more than 35 percent moisture, its solids contain not less than 45 percent of milkfat, and it is cured for not less than 6 months.

36. Section 133.104 is revised to read as follows:

§ 133.104 Asiago old cheese.

Asiago old cheese conforms to the definition and standard of identity and is subject to the requirements for label statement of ingredients prescribed by § 133.102 for asiago fresh cheese, except that it contains not more than 32 percent moisture, its solids contain not less than 42 percent of milk fat, and it is cured for not less than 1 year.

37. Section 133.106 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.106 Blue cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

38. Section 133.108 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.108 Brick cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that.

* * * * *

39. Section 133.111 is amended by revising paragraph (f) to read as follows:

§ 133.111 Caciocavallo siciliano cheese.

* * * * *

(f) Label declaration: Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that enzymes of animal, plant, or microbial origin may be declared as "enzymes".

40. Section 133.113 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.113 Cheddar cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

41. Section 133.118 is amended by adding new paragraph (f) to read as follows:

§ 133.118 Colby cheese.

* * * * *

(f) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that enzymes of animal, plant, or microbial origin may be declared as "enzymes".

42. Section 133.121 is amended by revising the introductory text to read as follows:

§ 133.121 Low sodium colby cheese.

Low sodium colby cheese is the food prepared from the same ingredients and in the same manner prescribed in § 133.118 for colby cheese and complies with all the provisions of § 133.118, including the requirements for label statement of ingredients, except that:

* * * * *

43. Section 133.123 is amended by revising the introductory text of paragraph (f) to read as follows:

§ 133.123 Cold-pack and club cheese.

* * * * *

(f) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that cheddar cheese, washed curd cheese, colby cheese, granular cheese, or any mixture of two or more of these, may be designated as "American cheese".

* * * * *

44. Section 133.124 is amended by revising paragraph (h) to read as follows:

§ 133.124 Cold-pack cheese food.

* * * * *

(h) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that cheddar cheese, washed curd cheese, colby cheese, granular cheese, or any mixture of two or more of these, may be designated as "American cheese".

45. Section 133.125 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 133.125 Cold-pack cheese food with fruits, vegetables, or meats.

(a) Cold-pack cheese food with fruits, vegetables, or meats or mixtures of these is the food which conforms to the definition and standard of identity, and is subject to the requirements for label declaration of ingredients, prescribed for cold pack cheese food by § 133.124, except that:

* * * * *

46. Section 133.127 is amended by revising paragraph (d) to read as follows:

§ 133.127 Cook cheese, koch kaese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130, except that enzymes of animal, plant, or microbial origin may be declared as "enzymes".

47. Section 133.128 is amended by revising paragraph (e) to read as follows:

§ 133.128 Cottage cheese.

* * * * *

(e) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that milk-clotting enzymes may be declared by the word "enzymes"

48. Section 133.129 is amended by revising paragraph (e) to read as follows:

§ 133.129 Dry curd cottage cheese.

* * * * *

(e) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that milk-clotting enzymes may be declared by the word "enzymes"

49. Section 133.131 is amended by revising the introductory text to read as follows:

§ 133.131 Lowfat cottage cheese.

Lowfat cottage cheese is the food prepared from the same ingredients and in the same manner prescribed in § 133.128 for cottage cheese and complies with all the provisions of § 133.128 (including requirements for the label statement of ingredients), except that:

* * * * *

50. Section 133.133 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.133 Cream cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be

declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

51 Section 133.134 is amended by revising the introductory text paragraph (d) to read as follows:

§ 133.134 Cream cheese with other foods.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

52. Section 133.136 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.136 Washed curd and soaked curd cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

53. Section 133.138 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.138 Edam cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

54. Section 133.140 is amended by revising paragraph (c) to read as follows:

§ 133.140 Gammelost cheese.

* * * * *

(c) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

55. Section 133.141 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.141 Gorgonzola cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

56. Section 133.144 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.144 Granular and stirred curd cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

57. Section 133.146 is amended by revising the introductory text of paragraph (e) to read as follows:

§ 133.146 Grated cheeses.

* * * * *

(e) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

58. Section 133.147 is amended by revising paragraph (e) to read as follows:

§ 133.147 Grated American cheese food.

* * * * *

(e) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that cheddar cheese, washed curd cheese, colby cheese, granular cheese, or any mixture of two or more of these may be designated "American cheese".

59. Section 133.148 is amended by revising the introductory text of paragraph (f) to read as follows:

§ 133.148 Hard grating cheeses.

* * * * *

(f) Label declaration: Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

60. Section 133.149 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.149 Gruyere cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

61. Section 133.150 is amended by revising the introductory text of paragraph (f) to read as follows:

§ 133.150 Hard cheeses.

* * * * *

(f) Label declaration: Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

62. Section 133.152 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.152 Limburger cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

63. Section 133.153 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.153 Monterey cheese and monterey jack cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

64. Section 133.154 is revised to read as follows:

§ 133.154 High-moisture jack cheese.

High-moisture jack cheese conforms to the definition and standard of identity and is subject to the requirement for label statement of ingredients prescribed for monterey cheese by § 133.153, except that its moisture content is more than 44 percent but less than 50 percent.

65. Section 133.155 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.155 Mozzarella cheese and scamorza cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

66. Section 133.156 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.156 Low-moisture mozzarella and scamorza cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

67. Section 133.158 is revised to read as follows:

§ 133.158 Low-moisture part-skim mozzarella and scamorza cheese.

Low-moisture part-skim mozzarella cheese and low-moisture part-skim scamorza cheese conform to the definition and standard of identity and comply with the requirements for label declaration of ingredients prescribed for low-moisture mozzarella cheese and low-moisture scamorza cheese by § 133.156, except that their milkfat content, calculated on the solids basis, is less than 45 percent but not less than 30 percent.

68. Section 133.160 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.160 Muenster and munster cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

69. Section 133.162 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.162 Neufchatel cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

70. Section 133.164 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.164 Nuworld cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

71. Section 133.165 is amended by revising paragraph (e) to read as follows:

§ 133.165 Parmesan and reggiano cheese.

* * * * *

(e) Label declaration: Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that enzymes of animal, plant, or microbial origin may be declared as "enzymes".

72. Section 133.167 is amended by revising the introductory text to read as follows:

§ 133.167 Pasteurized blended cheese.

Pasteurized blended cheese conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for pasteurized process cheese by § 133.169, except that:

* * * * *

73. Section 133.168 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 133.168 Pasteurized blended cheese with fruits, vegetables, or meats.

(a) Pasteurized blended cheese with fruits, vegetables, or meats, or mixtures of these is the food which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for pasteurized blended cheese by § 133.167, except that:

* * * * *

74. Section 133.169 is amended by revising paragraph (g) to read as follows:

§ 133.169 Pasteurized process cheese.

* * * * *

(g) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that cheddar cheese, washed curd cheese, colby cheese, granular cheese, or any mixture of two or more of these may be designated as "American cheese".

75. Section 133.170 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 133.170 Pasteurized process cheese with fruits, vegetables, or meats.

(a) Unless a definition and standard of identity specifically applicable is established by another section of this part, a pasteurized process cheese with fruits, vegetables, or meats, or mixtures of these is a food which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for pasteurized process cheese by § 133.169, except that:

* * * * *

76. Section 133.171 is amended by removing paragraph (f) and revising the introductory text to read as follows:

§ 133.171 Pasteurized process pimento cheese.

Pasteurized process pimento cheese is the food which conforms to the definition and standard of identity for pasteurized process cheese with fruits, vegetables, or meats, and is subject to the requirement for label statement of ingredients, except that:

* * * * *

77. Section 133.173 is amended by revising paragraph (h) to read as follows:

§ 133.173 Pasteurized process cheese food.

* * * * *

(h) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that cheddar cheese, washed curd cheese, colby cheese, granular cheese, or any mixture of two or more of these may be designated as "American cheese".

78. Section 133.174 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 133.174 Pasteurized process cheese food with fruits, vegetables, or meats.

(a) Pasteurized process cheese food with fruits, vegetables, or meats, or mixtures of these is the food which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for pasteurized process cheese food by § 133.173, except that:

* * * * *

79. Section 133.175 is revised to read as follows:

§ 133.175 Pasteurized cheese spread.

Pasteurized cheese spread is the food which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for pasteurized process cheese spread by § 133.179, except that no emulsifying agent as prescribed by § 133.179(e) is used.

80. Section 133.176 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 133.176 Pasteurized cheese spread with fruits, vegetables, or meats.

(a) Pasteurized cheese spread with fruits, vegetables, or meats, or mixtures of these is a food which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for pasteurized cheese spread by § 133.175, except that:

* * * * *

81. Section 133.178 is amended by revising paragraph (d) to read as follows:

§ 133.178 Pasteurized neufchatel cheese spread with other foods.

* * * * *

(d) Each of the ingredients used in the food shall be declared on the label as

required by the applicable sections of parts 101 and 130 of this chapter.

82. Section 133.179 is amended by revising paragraph (i) to read as follows:

§ 133.179 Pasteurized process cheese spread.

* * * * *

(i) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that cheddar cheese, washed curd cheese, colby cheese, granular cheese, or any mixture of two or more of these may be designated as "American cheese".

83. Section 133.180 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 133.180 Pasteurized process cheese spread with fruits, vegetables, or meats.

(a) Pasteurized process cheese spread with fruits, vegetables, or meats, or mixtures of these is a food which conforms to the definition and standard of identity, and is subject to the requirements for label statement of ingredients, prescribed for pasteurized process cheese spread by § 133.179, except that:

* * * * *

84. Section 133.181 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.181 Provolone cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

85. Section 133.182 is amended by adding paragraph (f) to read as follows:

§ 133.182 Soft ripened cheeses.

* * * * *

(f) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

86. Section 133.183 is amended by revising the introductory text of paragraph (f) to read as follows:

§ 133.183 Romano cheese.

* * * * *

(f) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

87. Section 133.184 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.184 Roquefort cheese, sheep's milk blue-mold, and blue-mold cheese from sheep's milk.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

88. Section 133.185 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.185 Samsoe cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

89. Section 133.186 is amended by revising paragraph (d) to read as follows:

§ 133.186 Sap sago cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

90. Section 133.187 is amended by adding new paragraph (g) to read as follows:

§ 133.187 Semisoft cheeses.

* * * * *

(g) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

91. Section 133.188 is amended by adding new paragraph (g) to read as follows:

§ 133.188 Semisoft part-skim cheeses.

* * * * *

(g) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

92. Section 133.189 is amended by adding new paragraph (e) to read as follows:

§ 133.189 Skim milk cheese for manufacturing.

* * * * *

(e) Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

93. Section 133.190 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.190 Spiced cheeses.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

94. Section 133.191 is revised to read as follows:

§ 133.191 Part-skim spiced cheeses.

Part-skim spiced cheeses conform to the definition and standard of identity, and are subject to the requirements for label statement of ingredients prescribed for spiced cheeses by § 133.190, except that their solids contain less than 50 percent, but not less than 20 percent, of milkfat.

95. Section 133.193 is amended by revising paragraph (a) to read as follows:

§ 133.193 Spiced, flavored standardized cheeses.

(a) Except as otherwise provided for herein and in applicable sections in this part, a spiced or flavored standardized cheese conforms to the applicable definitions, standard of identity and requirements for label statement of ingredients prescribed for that specific natural cheese variety promulgated pursuant to section 401 of the Federal Food, Drug, and Cosmetic Act. In addition a spiced and/or flavored standardized cheese shall contain one or more safe and suitable spices and/or flavorings, in such proportions as are reasonably required to accomplish their intended effect: Provided, That, no combination of ingredients shall be used to simulate the flavor of cheese of any age or variety.

* * * * *

96. Section 133.195 is amended by revising the introductory text of paragraph (d) to read as follows:

§ 133.195 Swiss and emmentaler cheese.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that:

* * * * *

PART 135—FROZEN DESSERTS

97. The authority citation for 21 CFR part 135 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

98. Section 135.110 is amended by revising paragraph (f) to read as follows:

§ 135.110 Ice cream and frozen custard.

* * * * *

(f) *Label declaration.* Each of the ingredients used shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that the sources of milkfat or milk solids not fat may be declared in descending order of predominance either by the use of all the terms "milkfat and nonfat milk" when one or any combination of two or more of the ingredients listed in § 101.4(b)(3), (b)(4), (b)(8), and (b)(9) of this chapter are used or, alternatively, as permitted in § 101.4 of this chapter. Under section 403(k) of the Federal Food, Drug, and Cosmetic Act, artificial color need not be declared in ice cream, except as required by § 101.22(c) or (k) of this chapter. Voluntary declaration of all colors used in ice cream and frozen custard is recommended.

99. Section 135.115 is amended by revising paragraph (d) to read as follows:

§ 135.115 Goat's milk ice cream.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

100. Section 135.120 is amended by revising the introductory text of paragraph (a) to read as follows:

§ 135.120 Ice milk.

(a) *Description.* Ice milk is the food prepared from the same ingredients and in the same manner prescribed in § 135.110 for ice cream and complies with all the provisions of § 135.110 (including the requirements for label statement of ingredients), except that:

* * * * *

101. Section 135.130 is amended by revising paragraph (e) to read as follows:

§ 135.130 Mellorine.

* * * * *

(e) *Label declaration.* Each of the ingredients used shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter, except that sources of milkfat or milk solids not fat may be declared in descending order of predominance either by the use of the terms "milkfat and nonfat milk" when one or any combination of two or more of the ingredients listed in § 101.4(b)(3), (b)(4), (b)(8), and (b)(9) of this chapter are used, or alternatively as permitted in § 101.4 of this chapter.

102. Section 135.140 is amended by revising paragraph (i) to read as follows:

§ 135.140 Sherbet.

* * * * *

(i) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

PART 168—SWEETENERS AND TABLE SIRUPS

103. The authority citation for 21 CFR part 168 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

104. Section 168.140 is amended by revising paragraph (d) to read as follows:

§ 168.140 Maple sirup.

* * * * *

(d) *Label declaration.* Each of the ingredients used in the food shall be declared on the label as required by the applicable sections of parts 101 and 130 of this chapter.

Dated: October 26, 1992.

21 CFR Parts 101 and 102

[Docket No. 80N–0140]

RIN 0095–AC48

Food Labeling; Declaration of Ingredients; Common or Usual Name For Nonstandardized Foods; Diluted Juice Beverages

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is amending the food labeling regulations to establish requirements for the declaration of the percentage of juice in foods that purport to be beverages containing fruit or vegetable juice. The agency is also revising the existing common or usual name regulation for diluted fruit or vegetable juice beverages. FDA is also revoking the common or usual name regulations for noncarbonated beverage products that contain no fruit or vegetable juice and for diluted orange juice beverages. This final rule responds to the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) and is part of FDA's ongoing rulemaking on juices and juice beverages.

EFFECTIVE DATE: May 8, 1993, except that amendments to part 102 become effective May 8, 1994.

FOR FURTHER INFORMATION CONTACT: Elizabeth J. Campbell, Center for Food Safety and Applied Nutrition (HFS–155), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202–205–5229.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of July 2, 1991 (56 FR 30452), FDA proposed requirements for the declaration of the percentage of juice in foods that purport to be beverages containing fruit or vegetable juice (hereinafter referred to as the July 2, 1991, proposal). There had been a longstanding controversy over percentage juice declaration in diluted fruit and vegetable juice beverages. The 1990 amendments (Pub. L. 101–535) settled the question of whether, and where, a declaration of the percentage of juice in a fruit or vegetable juice beverage must be included on the product's label. Section 7 of the 1990 amendments amends section 403(i) of the Federal Food, Drug, and Cosmetic Act (the act) (21 U.S.C. 343(i)) to require, that "if the food purports to be a beverage containing vegetable or fruit juice, it bear a statement with appropriate prominence on the information panel of the total percentage of such fruit or vegetable juice contained in the food." In the preamble to the July 2, 1991, proposal, FDA discussed questions remaining about the exact meaning and the implementation of this provision (56 FR 30452 at 30453). The agency proposed to add new § 101.30 to establish requirements for the percentage declaration, and to delete the similar provision from the existing common or usual name regulation for diluted fruit or vegetable juice beverages in § 102.33 (21 CFR 102.33)). The agency also proposed to make revisions to the requirements in § 102.33 pertaining to the product name. FDA also proposed to revoke the common or usual name regulations for noncarbonated beverage products containing no fruit or vegetable juice in § 102.30 (21 CFR 102.30) and for diluted orange juice beverages in § 102.32 (21 CFR 102.32). Because these products would be covered under proposed § 101.30 and the revised § 102.33, the agency tentatively found that separate regulations for these products are no longer needed. In addition, the agency withdrew its July 16, 1987, proposal to revoke the existing regulations on common or usual names for diluted fruit or vegetable juice beverages (52 FR 26690).

The agency received over 200 responses to the July 2, 1991, proposal from a wide range of sources, including consumers, consumer organizations, professional associations, State and local government agencies, manufacturers, and trade associations. Each of the responses contained one or more comments. Several comments addressed issues outside the scope of the July 2, 1991, proposal and will not be discussed here. A number of comments suggested modification of various provisions of the July 2, 1991, proposal. A summary of the relevant issues raised in the comments and the agency's responses follow.

II. Percentage Juice Labeling

A. Applicability (Covered Products)

Section 403(i) of the act requires that the label of any food that purports to be a beverage containing fruit or vegetable juice bear a percent juice declaration on the information panel. In the July 2, 1991, proposal, FDA described this requirement for percentage juice declaration as applying to full-strength juices and to various other standardized and nonstandardized fruit and vegetable beverages. The scope of the proposed regulation included waters, carbonated and noncarbonated beverages containing juice, juice nectars, diluted juices, wine coolers containing juice, and any beverage that contains no juice but whose labeling, color, or flavor represents, suggests, or implies that fruit or vegetable juice may be present.

1. One comment stated that the agency should not determine for consumers when a beverage purports or does not purport to contain juice. The comment stated that consumers will come to recognize the presence or absence of juice in a beverage by the presence or absence of a percent juice declaration.

The agency points out that the statute requires percentage declaration of fruit or vegetable juice on the label of a food if it "purports" to be a beverage containing vegetable or fruit juice. The agency is therefore obliged to base its requirements on whether or not the product purports to contain juice. FDA is applying its longstanding policy on whether a food purports to contain an ingredient, i.e., a food purports to contain an ingredient if it conveys, implies, or professes outwardly that it contains that ingredient; or the food has the appearance of being, intending, or claiming to contain that ingredient. The term "purports" is used in its ordinary sense, and includes what the food is accepted as by the average consumer under ordinary conditions of purchase as well as what it appears or is represented to be by labeling or other means. (*United States* v. *306 Cases Containing Sandford Tomato Catsup with Preservative*, 55 F. Supp. 725, 727 (E.D.N.Y. 1944); *United States* v. *30 Cases, More or Less, labeled in part: "Leader Brand Strawberry Fruit Spread,"* 93 F. Supp. 764 (S.D. Iowa 1950). Accordingly, a beverage purports to contain juice if it states or implies on the label that it contains juice or has the appearance of being juice or containing juice. New § 101.30(a) applies this policy for beverages.

2. Several comments said that FDA should be able to use extra-label sources of information, such as advertisements and store promotions as well as the beverage label, in determining whether percent juice declaration requirements apply. Several comments stated that percent juice declaration requirements should apply to carbonated soft drinks if a manufacturer uses advertising to represent that the firm's beverage contains juice. On the other hand, one comment opposed the use of extra-label sources of information to determine whether a product purports to contain

juice because there is no precedent for it.

The agency agrees that advertisements in the form of store promotions or other extra-label information stating or implying that the particular beverage contains juice result in the advertised beverage purporting to contain juice, and therefore percentage juice declaration is required. While FDA is not attempting to regulate advertising or claims made in advertising, contrary to the second comment, statements made in advertising have long affected the labeling of food products. FDA has given similar significance to advertising in the regulations on nutrition labeling (§ 101.9 (21 CFR 101.9)) and on the characterizing flavor labeling requirements (§ 101.22 (21 CFR 101.22)). In both of these instances, an advertising claim for a nutrition or flavor characteristic of a food invokes the requirement for nutrition labeling or flavor characterization labeling on the basis that the consumer who wants the food because of its particular nutrient content or flavor is entitled to examine a label that reveals facts material in light of the representations made, including those made in advertising, at the time of purchase. Similarly, FDA concludes that once a juice content claim is made for a beverage, the consumer who wants the product because of claims about its juice content is entitled to examine a label that provides juice content information at the time of purchase. Therefore, the agency is providing in new § 101.30(a) that advertising is a means by which a beverage purports to contain juice.

3. One comment expressed the belief that the requirement in the 1990 amendments for percent declaration of juice content does not apply to full-strength juice (including 100 percent juice prepared from concentrate). It stated that the 1990 amendments mandated this information for beverages that contain fruit or vegetable juices and not those that are 100 percent fruit or vegetable juice.

The agency disagrees with this interpretation of the statute. The statute states, "* * * if the food purports to be a beverage containing vegetable or fruit juice * * *." A single-strength juice product may contain a single juice as its only ingredient. A beverage that is a single-strength juice made from concentrate and water contains 100 percent juice. Likewise, a beverage that is a blend of more than one single-strength juice may contain 100 percent juice. The agency believes that using the interpretation in the comment would result in inconsistent requirements, e.g., the second and third types of products described above would bear percentage juice declarations, while the beverage consisting of one single-strength juice as its only ingredient would not.

The legislative history for this provision is not helpful in determining congressional intent. It states only: "Section 7(2) would require statements as to the percentage of fruit or vegetable juice contained in products sold as such juice." (136 Congressional Record—H5842 (July 30, 1990)). Thus, FDA finds no basis to conclude that Congress intended such an inconsistent outcome and therefore concludes that the interpretation of the statute in the comment is incorrect. Accordingly, the agency finds that beverages that contain only a single-strength juice are subject to the percentage juice declaration requirements.

4. A number of comments requested that juice flavored waters and seltzers be exempted from the requirement for declaration of percent of juice. They stated that the juice ingredient in these beverages is present in minor amounts (usually less than 2 percent) for flavoring, and that the beverages are not considered by consumers to be sources of juice. They stated further that naming the juice used as a flavor in the ingredient list should not be considered as purporting to be a beverage that contains juice. Several of the comments stated that a product should not have to declare percent of juice if the label states that it is flavored with the fruit juice, e.g., "———— flavored drink" or "A-B drink with a touch of lemon." The comments explained that the term "flavored" used with the common or usual name of the beverage informs the consumer that the juice is present in minor amounts for flavoring or taste, and that the beverage does not contain a significant amount of fruit or vegetable juice.

The agency agrees with the comments that a beverage flavored with a small amount of juice may not "purport to be a beverage containing juice" as that phrase is meant in the 1990 amendments. FDA believes that declaration of juice content provides information essential to the consumer in determining the nature of the product and reveals facts material in light of any representation made that the beverage contains juice. The agency considers that where a beverage contains a small amount of juice (usually less than 2 percent) for flavoring purposes, the label makes clear that the juice is present for flavoring, the word "juice" is not used on the label except in the ingredient list, the beverage is not represented as containing a significant amount of juice. In such a case, information on the amount of juice present would not be essential to describe the nature of the product. The agency concludes that such a product does not purport to contain juice within the meaning of the statute, and that therefore declaration of percent of juice is not required.

However, the label statement describing the flavor role of the small amount of juice must include the term "flavor" or "flavored" or otherwise indicate that the amount of juice is small and not use the word "juice." When a beverage contains a fruit or vegetable juice but does not use a form of the word "flavor" or otherwise indicate that the amount of juice is small, e.g., "lemon iced tea" or "lemon drink," the combination of the name of the fruit in the name of the product and declaration of the juice in the ingredient list implies that the beverage not only derives its flavor from the juice, but that it contains the juice. Thus, the product would purport to contain juice. In addition, use of the word "juice" in the flavor designation or elsewhere on the label, except in the ingredient list, would convey a similar impression. The statute requires the declaration of the percent of the juice in such circumstances.

In addition, the overall impression of the label, packaging, and physical characteristics of the beverage taken together may give the consumer the impression that the beverage contains juice and not just minor amounts of juice for flavor. For example, vignettes, such as one depicting juice flowing or oozing from a fruit or vegetable, or the physical characteristics of juice, such as the presence of pulp, would give the impression that the beverage contains juice. As described in new § 101.30(a), beverages bearing such representations purport to contain juice and are therefore required to bear the percent juice declaration.

Accordingly, the agency is including in the final regulation as new § 101.30(c) (proposed § 101.30(c) and (d) are deleted in response to comment 10 of this document) an exemption from percentage juice declaration for juice flavored beverages such as waters or seltzers provided that the beverage is labeled with a juice flavor description using the term "flavor," "flavored," or "flavoring" or otherwise makes clear that the juice is present in a small amount. To be exempt, the product's advertising, label, and labeling must not bear: (1) The term "juice" on the label other than in the ingredient statement, e.g., "seltzer water flavored with raspberry" or "seltzer water with a touch of raspberry;" (2) a vignette, e.g., depicting juice exuding from a fruit or vegetable; or (3) specific resemblance to

a juice, e.g., via distinctive juice characteristic such as pulp.

5. In the preamble to the July 2, 1991, proposal, FDA tentatively concluded that wine coolers and similar beverages containing less than 7 percent alcohol by volume that purport to contain unfermented fruit or vegetable juice are covered by proposed § 101.30 and are required to bear a percentage juice declaration (56 FR 30452 at 30454). While several comments supported this position, others objected, stating that wine coolers do not purport to contain juice but are juice flavored wine. The comments stated that many brands of wine coolers and some sangrias currently sold in the United States contain natural and artificial juice flavors rather than juice or pulp and are labeled in compliance with § 101.22, indicating that they contain flavors rather than juice. One of the comments stated that brands representing approximately 93 percent of all wine coolers sold in the United States are manufactured with fruit flavors rather than fruit juice. Several comments stated that wine coolers, including sangrias, should be treated in the same fashion as juice flavored soft drinks because consumers purchase wine coolers as alternatives to other alcoholic beverages, the same as soda drinkers who drink cherry cola when they want a change from regular cola.

The agency points out that wine coolers that do not contain unfermented juice are not covered by this regulation unless they purport to contain juice by means of advertising, labeling statements, vignettes, or physical characteristics. Thus, if a wine cooler does not contain any juice, has labeling that makes clear that it contains flavors rather than juice, and does not bear a vignette that implies fruit juice content, it is not subject to new § 101.30. In addition, FDA advises that noncarbonated beverages that purport to contain juice but do not, in fact, contain any juice were required by § 102.30 to state that they contain no juice. FDA concludes that this new regulation does not appreciably change the requirements for juice content declaration for the wine coolers referred to in these comments. Accordingly, no change in the regulation or its applicability is warranted by these comments.

6. Several comments stated that requiring percentage juice declaration on wine coolers is unfair because the same requirement does not apply to most other alcoholic beverages including spirits-based and malt-based coolers, which compete directly against wine coolers.

The agency advises that the labels of alcoholic beverages (those that contain 7 percent or more alcohol by volume and malt beverages) are regulated in accordance with the Federal Alcohol Administration Act (27 U.S.C. 205) administered by the Bureau of Alcohol, Tobacco and Firearms and are controlled differently from wine coolers. The labeling of wine coolers, like other beverages that contain less than 7 percent alcohol by volume, are regulated under the act. To the extent that these statutes differ, the products are regulated differently in other labeling aspects as well as in declaration of percentage juice content. It is not up to FDA, but to Congress, to decide that the same requirements must apply to wine coolers, other alcoholic beverages, and malt based beverages.

7. Some comments agreed with the agency proposal that traditional carbonated fruit-flavored soft drinks (sodas) have a substantial history of marketing as products with fruit flavor and are recognized as containing only fruit flavor and not necessarily fruit juice. These comments recommended that carbonated fruit flavored soft drinks be exempted from percentage juice declaration. However, several other comments said that the percent juice declaration regulation should apply if a soft drink manufacturer uses labeling to represent that a carbonated beverage does contain juice, such as vignettes depicting juice dripping from a fruit.

These comments are consistent with the preamble to the July 2, 1991, proposal, in which FDA stated that the label and labeling of soft drinks (sodas) generally do not give the impression through words or explicit vignettes that these beverages contain juice (56 FR 30452 at 30454). FDA therefore concludes that if a soft drink (soda) does not represent or suggest in the name, labeling statement, or ingredient statement that it contains fruit or vegetable juice, there is no basis to find that it purports to contain juice. Accordingly, for clarity the agency is adding a statement to that effect to the regulation in § 101.30(a). However, FDA also concludes that, as discussed in the preamble to the July 2, 1991, proposal, a soft drink (soda) that contains ingredients, such as pulp, that give the impression that it contains juice or that bears an explicit vignette that gives the impression of juice content, purports to contain juice (56 FR 30452 at 30454). Such a product would be required under § 101.30(d) to declare juice content. In addition, those soft drinks that do contain juice usually make that fact known. These products purport to contain juice and are subject to the percentage juice declaration requirement.

8. In the July 2, 1991, proposal, FDA also addressed requests for exemption from percentage declaration for bulk juice concentrates for institutional use. The agency stated that it was not proposing to exempt these bulk concentrates because of a lack of information substantiating the need or value of such an exemption. Some comments requested exemption from percent juice declaration for bulk juice concentrates for institutional use because they claimed this information is provided to consumers in other ways by the institution, and the institution specifies the juice content of the product in contracts and purchasing agreements.

Because these comments provided no additional information to support their assertions, the agency still does not have information that demonstrates a need for an exemption from percentage juice declaration for bulk juice concentrates for institutional use. Therefore, FDA is not including such an exemption in this final rule.

However, those requesting an exemption from percentage juice declaration for bulk juice concentrates for institutional use may petition for such an exemption under § 10.30 (21 CFR 10.30), providing the agency with information such as actual contracts or purchasing agreements specifying juice content and verifiable instances and examples of the percentage juice content presentation provided to consumers served the juice derived from the bulk juice concentrates by specific institutions, as well as data demonstrating the extent of use of these products by institutions.

9. Some comments requested exemption from percent juice declaration for bulk concentrates intended for further processing because consumers would not see the labeling, and manufacturers require bulk concentrate that meets their specifications from their suppliers.

The agency advises that bulk concentrates for further processing are covered by the exemptions provided in § 101.100(d) (21 CFR 101.100(d)). That regulation specifies criteria for exemption from labeling requirements including those of section 403(i) of the act. Therefore, there is no need to grant a new exemption.

B. What Percentage Must be Declared

Section 403(i) of the act, as modified by section 7(2) of the 1990 amendments, requires that if a food purports to be a beverage containing fruit or vegetable juice, it must bear a statement of "* * *

the total percent of such fruit or vegetable juice contained in the food * * *." In the July 2, 1991, proposal, FDA tentatively concluded that this statement could be read two ways, one to require declaration of percent of total juice and the other to require declaration of percent of each juice represented to be in the beverage. The agency found that under either reading a material fact would not be disclosed. Reading section 403(i) of the act together with section 201(n) of the act (21 U.S.C. 321(n)) and section 403(a) of the act, FDA proposed to require declaration of both the percent of total juice and the percent of each juice represented to be in a multiple-juice beverage.

10. Many comments opposed the requirement for declaration of percent of individual juices in multiple-juice beverages. They cited the following reasons for their opposition: (1) The statutory language of the 1990 amendments does not require declaration of percent of individual juice in multiple-juice beverages; (2) proprietary formula information would be revealed by a 1-percent increment declaration of individual juices; (3) variable (least cost) juice blend formulation driven by fluctuations in cost or availability of individual juices would be eliminated with the proposed 1-percent increment label declaration requirement as labels would have to be changed to reflect formulation changes; (4) the requirement is unenforceable with current analytical methodology; (5) there are no data or information that demonstrate consumer interest in or benefit from the requirement; and (6) label clutter on the information panel would be increased.

In contrast, other comments supported the proposed requirement for individual juice percentage declaration, stating: (1) The 1990 amendments clearly require a total percent juice declaration, and it does not follow that Congress did not intend for the consumer to be fully apprised of the identity and amount of the juices that make up the declared total amount of juice; (2) some juice beverages have misleading labels in that high cost/value or intense flavor juices are given greatest label prominence but are present in minor amounts; (3) some manufacturers misrepresent the juice content of their beverage through the use of added pulp, clouding agents, and thickening agents which mislead consumers into believing that these beverages have more juice than is actually present; (4) more precise, direct information on relative amounts of specific juices in multiple-juice beverages is needed by consumers to make in-store purchasing decisions; (5) among multiple-juice beverages with the same total juice percentage, a juice's order of predominance in the ingredient statement does not directly translate to its percentage in the beverage; and (6) enforcement actions by Federal, State, and local consumer protection agencies will be needed less often because the percent of individual juice declaration will remove possible ambiguity as to whether a product label may be misleading to the consumer.

The agency has reconsidered its interpretation of the amendment to section 403(i) of the act in light of the arguments presented in the comments. The agency notes the contrast in language in section 403(i)(2) of the act, which, on the one hand, requires the declaration of the common or usual name of "each such ingredient" when a product is fabricated from two or more ingredients but only the declaration of the total juice percentage of "such" fruit or vegetable juice contained in the food, not "each" fruit or vegetable juice contained in the food. Thus, had the intent of Congress been to require percent individual juice declaration, it clearly knew how to do so. Based on the face of the law, it is reasonable to expect that Congress would have used the word "each" in place of, or preceding, the word "such" in the phrase "such fruit or vegetable juice," as it did in the phrase "each such ingredient." Without relevant legislative history on the provision, FDA now finds that the better reading of section 7 of the 1990 amendments is that it requires declaration of percent of total juice but not declaration of percent of individual juices in a multiple-juice beverage.

Nor is it clear that the percent of each individual juice represented on the label is a material fact under section 201(n) of the act for all multiple-juice beverages. In the July 2, 1991, proposal, FDA stated that if the label of a beverage declared the presence of one or more juices by representation (i.e., word or vignette) and declared the total percentage of juice in the product, but did not declare the percentage of each individual represented juice, the label would be misleading (56 FR 30452 at 30456). The agency tentatively found that such a label would create an impression that overstates the amount of the represented juices in the beverage if not all the juice in the beverage is supplied by the represented juices.

While beverage labels clearly are misleading if they misrepresent the contribution of one or more individual juices to the total amount of juice, the agency acknowledges that not all multiple-juice beverage labels that bear representations of individual juices misrepresent the contribution of the individual juices to the total. For example, a vignette that depicts all the fruits or vegetables in the product may not misrepresent an individual juice contribution. In addition, declaration as a part of the product name of all juices present (in descending order by volume of single-strength juice) would generally not be misleading.

Accordingly, FDA is not including in the final regulation the requirements in proposed § 101.30(c) and (d) for the declaration of the percent of juice for all juices in multiple-juice beverages that are declared in the label or labeling, by word, vignette, or other means, other than inclusion in the statement of ingredients, to be present in the beverage. The agency is also deleting proposed § 101.30(e), which provided for optional declaration of percent of individual juices not represented on the label. Instead, the agency has included in the final regulation on the common or usual name of such beverages, provisions for adequately descriptive names that will inform the consumer of the nature of the product. As discussed in detail in Section III. of this document, for beverages where one or more but not all the juices are named and the named juice is not the predominant juice, the agency is providing two alternatives for describing the contribution of the named juice. The label must either state that the beverage is flavored by the named juice (e.g., "raspberry flavored juice drink") or declare the content of the named juice in a 5 percent range (e.g., "raspberry juice drink 2 to 7 percent raspberry juice"). The agency believes that this approach will adequately deal with the kinds of misleading labeling discussed in the comments from consumer groups.

Because FDA is deleting the requirement for declaration of percent of individual juice content in multiple-juice beverages, a number of comments are no longer relevant. Such comments include those regarding which juices should be included in the percent of individual juice declaration and the impracticability of declaring individual juices in 1-percent increments. The agency is not addressing these comments because the concerns they express are moot. In addition, allegations that this regulation would result in a compensable taking of private property are no longer relevant. These allegations were based on the contention that a requirement for declaration of percent of individual juices would be a mandatory disclosure of proprietary information and would thereby constitute a taking. Because the

requirement in question has been deleted, there is no need for FDA to address the issue.

11. No comments objected to the requirement that the declaration of percent of total juice be in 1-percent increments. However, several comments pointed out that the regulation should provide for beverages that contain less than 1 percent juice. They stated that to have a "0 percent juice" declaration on a product with juice declared in the ingredient list would be confusing to the consumer. One comment suggested that FDA provide for a statement such as "less than 1 percent juice" instead of requiring "0 percent juice" for those products that contain juice at a volume of less than 1 percent.

The agency agrees that a declaration of juice content of less than 1 percent may be appropriate if it accurately describes the amount of juice in the product. Therefore, FDA is revising the provisions in new § 101.30(b) for percentage juice declaration to allow for this declaration.

C. How Declarations Should Be Made—Placement and Prominence

Section 403(i)(2) of the act requires "a statement with appropriate prominence on the information panel" of the percentage of juice. The agency proposed requirements that it believed would provide appropriate prominence for the percentage juice declaration and still allow room for other required information. The agency proposed in § 101.30(g) that if the beverage is sold in a package that has an information panel, the percentage juice declaration is to be prominently placed near the top of the information panel, with no other printed label material appearing above it. Additionally, the agency proposed to require that the declaration be in easily legible boldface print or type in distinct contrast to other printed or graphic matter, in a height not less than the largest type found on the information panel except that used for the product name, and in lines generally parallel to the base on which the package rests.

The agency also proposed in § 101.30(h) that the percentage juice declaration may also be placed on the principal display panel if the declaration is consistent with that presented on the information panel. Further, the agency proposed in § 101.30(i) that if the beverage package does not include an information panel, the percentage juice declaration must be placed on the principal display panel: (1) In type size not less than that required for the declaration of net quantity of contents statement, (2) located near the name of the food, and (3) in lines generally parallel to the base on which the package rests. (Paragraph designations of new § 101.30 have been changed to paragraphs (e), (f), and (g), respectively, as a result of changes discussed in response to comment 10 of this document.)

12. Some comments suggested that the total juice content should be required to be placed at the top of the principal display panel with the common or usual name. They stated that otherwise the declaration of total juice would not have appropriate conspicuousness or prominence, because many consumers do not routinely, or cannot easily, read fine print, i.e., one-sixteenth of an inch minimum height, on the information panel.

The agency advises that the act requires that the percent juice declaration be on the information panel. The comments did not provide a legal basis on which the agency could require an additional declaration on the principal display panel. However, as provided in new § 101.30(f), the agency is permitting percent total juice on the principal display panel as an optional declaration.

13. Several comments stated that in addition to the percent juice declaration on the information panel, percent juice declaration should be allowed on the principal display panel.

As stated in response to the previous comment, the agency does not object to the additional declaration of percent juice content on the principal display panel, provided that it is consistent with the declaration on the information panel. This additional declaration is provided for in new § 101.30(f).

14. Although no comments objected to the requirement that a total percent juice declaration appear on the principal display panel in the absence of an information panel, some comments objected to the requirement that placement of the percent juice declaration on the principal display panel be near the name of the food. These comments asserted that there is no compelling reason for such placement, and that there should be more flexibility in the location of the declaration.

The agency disagrees with the comments. Consumer use of the percent juice content declaration will be facilitated if it is in a consistent, prominent location on the food label. The comments did not recommend alternative placement criteria.

Currently, some juice beverage labels bear percent juice statements such as "100 percent juice" or "100 percent juice blend" on the principal display panel near the name of the juice product. Because of the longstanding industry tradition of marketing food products bearing percentage claims near the name of the food on the principal display panel, and because of agency regulations providing for such percentage declarations in association with the common or usual names of nonstandardized foods (§ 102.5(b) (21 CFR 102.5(b))), consumers have become accustomed to seeing such percent juice information, when it appears on the principal display panel, near the name of the food. Therefore, the agency concludes that the proposed requirement for placement of the percent juice declaration on the principal display panel near the name of the food, if there is no information panel, provides appropriate prominence as required by the statute. This requirement is set forth below as new § 101.30(g).

15. Several comments objected to the proposed requirement that the percent juice declaration be near the top of the information panel with no printed information appearing above it. These comments wanted more flexibility to use available label space efficiently and to minimize label clutter that they said would result from declaration of percent juice statements near the top of the information panel. The comments stated that the 1990 amendments did not mandate that the percentage juice declaration be the most prominent or conspicuous item on the information panel. Finally, the comments said that the July 2, 1991, proposal gives the declaration more prominence than health and safety statements such as those required for saccharin section 403(o) and (p) of the act (codified at 21 CFR 100.130(d)(2), 101.11, 105.66(b) and 180.37) or phenylalanine (21 CFR 172.804(e)(2)), and other statements concerning storage, preparation, recycling, and deposit information. The comments requested that they have, at a minimum, the option of placing such information as the brand name, product name, product logos, and the universal product code (UPC) above the percentage juice declaration.

The suggestion in the comments that required information on the information panel is not more important than optional information, and should have equal but not greater prominence, is contrary to existing regulatory requirements that have not been changed by the 1990 amendments. The agency is not requiring that the percent juice declaration be the most prominent and conspicuous item on the information panel by virtue of its placement near the top of the

information panel. FDA considered that the same regulations that currently apply to labeling information appearing on the information panel (§ 101.2 (21 CFR 101.2)) will also apply to the total percent juice declaration and did not wish to unduly disrupt the customary sequence of required information on the information panel, i.e., nutrition information, ingredient statement, and name and place of business of the distributor (§ 101.2(b)). Further, because the percentage juice declaration is now required information, the agency believes it must be at least as prominent as other required information to have the "appropriate prominence" required by the statute (21 CFR 101.2(c) and 101.15).

Consistent with these considerations, the agency finds that placing optional information such as storage instructions and recipes, which need not appear on the information panel at all, above the total percentage declaration, and consequently above all other required information on the information panel, will not give the percentage declaration "appropriate prominence." The comments did not provide any examples or information to substantiate a need for additional flexibility, and the agency is not convinced by the comments' assertions that the prominence and placement of the required total percent juice declaration is unreasonably restrictive.

However, having considered all the comments on this issue, the agency concludes that since the product name or brand name or logo often appear at the top of the information panel, they may continue to appear above the percentage juice declaration on the information panel. However, any additional printed material, other than product name or brand name or logo that appears above the percentage juice declaration will render the percent juice declaration so inconspicuous that the "appropriate prominence" required by the 1990 amendments will not be provided. Consistent with past agency practice, foods whose labeling omits or fails to prominently or conspicuously convey required information, and instead utilizes available label space to give prominence and conspicuousness to nonmandatory information, will be subject to legal action.

Finally, FDA considers the UPC to be a sufficiently distinctive label feature that it does not affect the prominence and conspicuousness of other information on the label. The agency has therefore not seen a need to regulate its location on the label in relation to required information. Consequently, the final regulation does not prohibit the UPC from appearing above the percentage declaration on the information panel.

Accordingly, the agency is revising the regulation in new§ 101.30(e)(1) to include the words "except the brand name, product name, logo, or universal product code" after the word "statement."

16. Several comments objected to the requirement that the percent total juice declaration be not less than the largest type on the information panel except that used for the product name because it gave the percent declaration undue prominence. These comments asserted that the type size requirements should not be any greater than for other required information, i.e., a minimum one-sixteenth of an inch in height unless exempted pursuant to § 101.2(f). Additionally, the comments asserted that type size requirements should relate only to type size of the required information on the information panel and not to the brand name, product name, UPC, or any other nonmandatory information on the information panel. One comment suggested a minimum 3/32 of an inch type size instead of the proposed one-sixteenth of an inch on large containers such as half-gallon cartons, so that the print size would be more proportional to other printed material on the carton.

In the July 2, 1991, proposal, the agency attempted to strike a balance between "appropriate prominence" for the percent juice declaration and that of other required information and of nonmandatory information on the information panel. The agency believes that the total percentage juice declaration should be at least as prominent as any other information on the same panel, whether required or not. However, because the agency also recognized that manufacturers may desire to place the product name prominently on the information panel, it proposed to exclude the name from consideration relative to the type size for the total percent juice declaration. Consistent with the decision above to permit brand name, product name, logo, or UPC to be located above the percent juice declaration, the exclusion from type size comparison should also apply to the brand name and the logo. The agency also did not intend to include the UPC among the label information on which type size for the percent juice declaration is based. As stated above, it considers that the UPC is sufficiently distinctive in appearance that it does not interfere with the prominence or conspicuousness of other label information.

In meeting the mandate of the 1990 amendments for appropriate prominence of the percentage juice declaration, FDA did not wish to deviate unnecessarily from existing type size requirements or to establish new type size requirements such as the requested 3/32 of an inch type size for large containers. The comment requesting larger minimum type size for large containers did not provide information to substantiate a need for larger type or to demonstrate that the 3/32-inch type size would be appropriate to meet such a need. Therefore, FDA is retaining the one-sixteenth of an inch minimum type size provision in the final rule.

To summarize, the type size requirement of not less than the largest type on the information panel with the exception of product or brand name, the logo, and the UPC ensures a certain proportionality of type size for required and nonmandatory statements. This proportionality of type size both provides for "appropriate prominence" of the percentage juice declaration and helps to curb instances of inappropriate prominence of nonmandatory information over required information on the information panel.

Therefore, the agency is requiring in new § 101.30(e)(2) that the declaration of percentage juice be prominently placed on the information panel, appearing in easily legible boldface type, in distinct contrast to other printed or graphic matter, in a height not less than the largest type on the information panel except for that used for the brand name, product name, logo, or UPC.

17. Some comments objected to the requirement in proposed § 101.30(g)(2) that the percentage juice declaration on the information panel be in lines generally parallel to the base upon which the package rests. They stated that the requirement limits the flexibility of beverage manufacturers in placement of the required declaration and other required information on the information panel. Several other comments suggested that the percent juice declaration be in lines generally parallel to other required information, whether or not this information is also parallel to the base on which the package rests.

The agency advises that placing required information on the principal display panel in lines other than generally parallel to the base upon which the package rests requires the consumer to unnecessarily manipulate the package to read the required information, making it less likely to be read. Consistent with this fact,

statements of identity and net quantity of contents are required to appear on the principal display panel in lines generally parallel to the base upon which a package rests (§§ 101.3(d) and 101.105(f) (21 CFR 101.3(d) and 101.105(f)), respectively).

However, the agency agrees with the comments that requiring that the percent juice declaration be on the information panel in lines generally parallel to the base is not justified because other mandatory information on the information panel is not required to be in lines generally parallel to the base of the package. The regulations in § 101.2 do not include specific orientation requirements for mandatory declarations such as the ingredient statement, nutrition labeling, or name and place of business of the manufacturer, packer, or distributor.

Accordingly, FDA concludes that because it does not have substantial justification for this additional orientational requirement and in light of objections from comments, the proposed requirement should be withdrawn. Therefore, FDA has deleted the phrase "and in lines generally parallel to the base on which the package rests" from proposed § 101.30(g)(2) (redesignated as new § 101.30(e)(2) in this final rule).

The agency, however, is persuaded by the suggestion in the comments that the percent juice declaration should be in lines generally parallel to other required information, whether or not this information is also parallel to the base on which the package rests. Because existing § 101.2(e) provides that all information appearing on the information panel pursuant to this section must appear in one place without intervening material, it is reasonable that the percent juice declaration should be in lines generally parallel with this information, so that the consumer will not have to manipulate the package to read all the required information. This orientational requirement will ensure that appropriate prominence of the percent juice declaration is maintained. Therefore, the agency has inserted the phrase "in lines generally parallel to other required information" after the word "panel" in new § 101.30(e).

D. Associated Label Statements

In the July 2, 1991, proposal, FDA discussed declarations that use a percentage (usually 100) to describe a term other than juice, such as "100 percent pure" or "100 percent natural" (56 FR 30452 at 30457). The agency stated that these declarations have a great potential to mislead the consumer into believing that the product is 100 percent juice. FDA advised that such statements should not be used. In addition, the agency requested comments as to whether FDA should adopt regulations specifically providing that declarations such as "100 percent pure" or "100 percent natural" or "100 percent" to describe a term other than juice are misleading, particularly when used on the principal display panel of diluted juice beverages.

18. Several comments stated that the terms "pure" and "natural" are ambiguous and tend to mislead consumers about the nature of a product. These comments stated that at times, the terms "pure" and "natural" mislead a consumer into believing that the product consists entirely of juice. A number of comments stated that using the term "100 percent" with the terms "pure" and "natural" exaggerates and exacerbates the already ambiguous and misleading nature of the terms "pure" and "natural" on diluted juice beverages. These comments said that consumers are consistently confused and misled by such statements into believing that the beverages are all juice with no additional ingredients or are full-strength (100 percent) juice. These comments stated that the use of these phrases should be restricted by FDA because most juice beverages are not 100 percent juice, or they are processed, i.e., reconstituted with water and ingredients other than juice such as sweeteners, preservatives, flavors, colors, pulp, and thickening and clouding agents to restore the juice to its original expressed juice state, to compensate for seasonal or regional variations, or to create a unique juice based beverage.

Opposing comments stated that the terms "pure" and "natural" can be used in some contexts in which they would not be misleading. These comments argued that consumers read the terms "pure" and "natural" to mean that the product is made of natural ingredients such as fruit juices, water, natural sweeteners, and flavors. They recommended that labels bearing the terms "pure" and "natural" be evaluated on a case-by-case basis.

Several comments were of the opinion that use of a percentage to describe an undefined attribute on products required to bear a percent juice declaration could potentially be misleading to consumers. They stated that therefore, any use of "100 percent" on the label in conjunction with an undefined term should be prohibited unless the product is a full-strength (100 percent) juice product. However, these comments stated that this policy should not restrict use of a percentage declaration that is clearly defined as not being related to juice content, i.e., "contains 100 percent of U.S. Recommended Daily Allowance (U.S. RDA) for Vitamin C."

The agency advises that while there is no specific prohibition against the use of the terms "pure" and "natural," it has discouraged the use of these terms because they are ambiguous and may be misleading. For example, "orange juice," "pure orange juice," and "100 percent pure orange juice" are identical foods, but "pure" as applied to the food implies that other identical products are "impure" or "not pure" if they do not bear the same term on their label. The term "natural" is similarly ambiguous when applied to any food except flavors and flavorings.

The agency concludes that this rulemaking is not the appropriate vehicle to consider whether terms such as "pure" and "natural" should be permitted on juice product labels. The comments presented opinions on the word "pure," but they did not provide sufficient information on which to base a regulation. The term "natural" is included in another agency rulemaking. In the **Federal Register** of November 27, 1991 (56 FR 60421 at 60466), FDA published a proposal entitled "Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms" that included, among other things, a discussion of various aspects of defining the term "natural." A final rule based on that proposal is published elsewhere in this issue of the **Federal Register.** In that rulemaking, however, the agency decided not to define the term "natural."

However, FDA also concludes that the use of a percentage, particularly 100 percent, in conjunction with terms other than "juice," such as "pure" and "natural," on a beverage that is not full-strength juice can be misleading, particularly where the 100 percent figure appears near the name of the product but not in close proximity to a prominent declaration of the percentage of juice. On the other hand, FDA agrees with those comments that stated that statements clearly unrelated to juice content, e.g., "provides 100 percent of U.S. RDA of vitamin C," are not misleading.

Therefore, to clarify these matters, under sections 403(a) and 701(a) of the act (21 U.S.C. 371(a)), the agency is including in the final regulation a prohibition on the use of "100 percent" or any other percentage unrelated to juice content that could be misunderstood to represent the percent of juice in the beverage. This provision in the final regulation, designated new

§ 101.30(l), states: "A beverage required to bear a percentage juice declaration on its label shall not bear any other percentage declaration that describes the juice content of the beverage in its label or in its labeling (e.g., "100 percent natural" or "100 percent pure"). However, the label or labeling may bear percentage statements clearly unrelated to juice content (e.g., "provides 100 percent of U.S. RDA of vitamin C").

E. Calculation of Percentage Juice

1. Juice From Concentrate

The agency proposed that in enforcing the act and in ensuring that percentage juice declarations are truthful and not misleading, it would calculate the percentage juice from concentrate in a juice or juice beverage using the minimum Brix levels that were listed in proposed § 101.30(j)(1). (Because of revisions to the final regulation proposed § 101.30(j) is redesignated as new § 101.30(h)). In the July 2, 1991, proposal, the agency strongly recommended that manufacturers use this method in calculating the percentage juice from concentrate. The agency also advised that if the July 2, 1991, proposal were adopted, while manufacturers may use any appropriate alternate method, they should ensure that this alternate method produces similar results.

In the preamble to the July 2, 1991, proposal, FDA listed proposed minimum Brix values for a number of fruit and vegetable juice products and minimum anhydrous citric acid contents for two fruit juices, based primarily on data from the National Juice Products Association (NJPA) in December of 1989 and May of 1990 (56 FR 30452 at 30466).

FDA received comments on 13 of the 51 proposed minimum Brix values for 100 percent juice and comments regarding minimum Brix values for two other juice products not listed in the proposed regulation. Most comments claimed that one or more of the 13 values were too high and offered information or data to support their claims. Several comments simply objected to the proposed Brix values as being too high without suggesting more appropriate values. Brix data in the comments were provided in several forms: Individual values, ranges of values, monthly or yearly averages, and mean values with designated standard deviations. A presentation of the data submitted, and the agency's review and conclusions, follow.

a. Evaluation of Brix data in comments.

FDA acknowledges that much of the Brix data in agency files is old and may be out of date. The Brix data used in establishing the fruit or fruit juice content in the standards of identity for fruit butter and fruit jelly (§§ 150.110 and 150.140 (21 CFR 150.110 and 150.140)) were obtained from authentic fruit samples collected before 1940. Although the data were used for many years without question for fruit butters and fruit jelly, when these data were incorporated in the standard of identity for canned nectars, FDA received an objection that questioned the applicability of the single-strength juice values to canned nectars and suggested that they be reevaluated in light of current commercial practice in the manufacture of nectars. Thus, the standard for canned nectars (§ 146.113 (21 CFR 146.113)) was stayed in 1968 (33 FR 10713, July 27, 1968).

Differences in juice composition that result from factors such as horticultural practices, processing operations, and geographical origin, as well as the use of new varieties of certain species, may account for differences in Brix values obtained on juice products prior to 1940 and values obtained for fruit juices currently produced under current good manufacturing practice. In reviewing the data submitted in comments, FDA has consulted published references on juice composition, e.g., U.S. Department of Agriculture (USDA) Food Composition Tables (Handbook 8–9: Fruits and Fruit Products and Handbook 8–11: Vegetables and Vegetable Products) (Refs. 5 and 6). FDA has also reviewed Brix data in files that were used in support of existing standards of identity and data contained in published articles on juice research and composition. In instances where there are established values in standards of identity that appear to be too high compared to newer information, and the data submitted in support of lower values seem reasonable in light of this newer information, FDA has adopted a lower value in new § 101.30(h)(1). Where FDA has adopted a lower Brix value for 100 percent juice than is currently listed for the fruit juice in an existing standard of identity, FDA intends to consider revision of the standard of identity at a later date to make it consistent with the Brix value that the agency is adopting in this regulation.

b. Use of Brix data.

19. Several comments supported FDA's proposal to calculate the labeled percentage of juice from concentrate in a reconstituted juice or in a diluted juice beverage based on the minimum Brix standards. One comment expressed the opinion that the Brix concept represents the most workable method for accurately and consistently calculating the percentage of juice. A comment from the Government of Canada also expressed support for specifying minimum Brix values for use in calculating the percentage of juice included in diluted juice beverages and reconstituted juices. However, the comment stated that it does not support the proposed Brix values because they would effectively exclude Canadian products from the U.S. market. Other comments in the letter from the Government of Canada on specific juices are discussed below. One comment opposed the proposed method of calculating the percentage of juice based on minimum Brix values, established by regulation, instead of requiring the percentage of juice to be calculated in terms of the actual soluble solids content of the original juice. The comment maintained that use of the table of fixed Brix values in proposed § 101.30(j)(1) (redesignated as new § 101.30(h)(1)), which, the comment contended, contains values well below the Brix of sound ripe fruit, gives food processors a license to overstate the quantity of juice in their products.

FDA recognizes that when a minimum Brix value based on the mean or a range of values for a particular fruit or vegetable juice is established by regulation, there will always be some juices that will have Brix values above the minimum, and some juices that will be below the minimum because of natural variations in the source fruits and vegetables. The agency also acknowledges that, in some instances, producers of lower Brix juices will have to use more juice to meet the minimum soluble solids requirements for reconstituted full-strength juice. However, use of standardized Brix levels in preparing and labeling blended juice products and diluted juice products from concentrates will ensure that consumers obtain products with a reliably determined minimum juice soluble solids content. As a result consumers will be able to make meaningful value comparisons between brands of such products based on the labeled juice content. Use of actual Brix levels of the original juice used to manufacture the concentrates could lead to variations in the levels of soluble solids on labels of products that bear the same percentage juice declaration. Therefore, FDA is not modifying its proposed use of standardized minimum Brix levels to determine the percent juice in juice products made from

concentrate, as requested by the comment.

c. Approaches other than use of Brix.

20. One comment proposed an alternative to Brix calculation for percentage juice in the case of orange juice and other citrus juices that have been modified by the removal of the naturally occurring sugars that are then replaced partially or wholly by intense sweetening agents. The proposed method would use citric acid content or the ascorbic acid content consistent with FDA's proposal for lemon juice and lime juice.

The comment provided guide values of 8.0 grams per liter citric acid and 200 milligrams per liter ascorbic acid for orange juice as an alternative for the determination of percentage juice for orange juice with sugars removed and referenced methods for determination of the citric acid and ascorbic acid content ("RSK–Values, The Complete Manual, Guide Values and Ranges of Specific Numbers, Including the Revised Methods of Analysis," Verband der deutschen Fruchtsaftindustrie e.V., Bonn, 1987). However, the comment did not include any data to correlate and verify these values and methods as they apply to an "artificially sweetened, sugars-reduced orange juice."

The agency is not incorporating the suggested alternative method for determining the percentage of "juice" contributed by modified juices in which the native sugars have been removed and have been replaced wholly or partially by intense sweetening agents. As discussed in section II. F. of this document, these products are not considered to be juice. Under new § 101.30(h)(1), FDA is establishing minimum Brix values for fruit and vegetable juices based on the soluble solids content (i.e., primarily sugars content of the juice), with the exception of lemon juice and lime juice that are defined by citric acid content, for use in percent juice labeling. Therefore, such modified juices cannot be included in the percent juice calculation or depicted as juice in the vignette on a beverage. The description of the modification (e.g., "sugar-reduced orange juice") as part of the common or usual name of the product makes clear that the change in the product is such that it no longer purports to be juice. The product may substitute for juice, but it is not juice. Although the suggested alternative methodology may be useful for validating claims about modified juice products, the agency is not aware of acceptable methodology to confirm the content of any modified juice products, e.g., "reduced sugars" or "sugars removed" juice products.

d. Meaning of Brix standards.

21. One comment stated that from the proposed single-strength Brix standards, it is not clear whether the standards are intended to represent mean values, or whether they are minimum values. In some instances, e.g., in normalizing compositional data of juice concentrates, the comment stated, it may be appropriate to use mean values. In other instances, minimum values may be more appropriate, e.g., regulations for 100 percent fruit juice made from concentrate.

The agency advises that the Brix values set out in new § 101.30(h)(1) are minimum values that are based on average values for the respective juice products. As stated in the preamble to the July 2, 1991, proposal, the purpose of establishing these Brix values for 100 percent juice is to provide a "minimum" acceptable level for determining whether a juice should be considered to be full-strength (56 FR 30452 at 30459).

e. How Brix values are set.

22. One comment stated that it is desirable to take a statistical approach in revising or establishing the Brix values. The comment stated that in some instances, it may be appropriate to use "mean" values, e.g., normalizing compositional data of juice concentrates; and in other instances, minimum values may be more appropriate, e.g., in establishing minimum Brix requirements to define 100 percent fruit juice from concentrate. The comment added that where minimum Brix values are appropriate, the minimum value could be one standard deviation below the mean if 66 percent confidence limits were applied, or two standard deviations if 95 percent confidence limits were thought to be more appropriate. For some juices, e.g., orange juice and apple juice, the comment maintained that there should be adequate data bases available for such statistical applications. For many commodities, the data will need to be developed. The comment also maintained that there needs to be agreement on the sample protocol for developing such data bases.

FDA agrees that a statistical approach should be used to establish the minimum Brix values when adequate data bases are available. However, because of the limited amount of data available to FDA for most juice products for which minimum values were proposed, a statistical approach could not be used. Where comments supplied Brix data in statistical terms, means and standard deviations, FDA used these data in evaluating the proposed Brix values and in some instances has incorporated these values in new § 101.30(h)(1). In other instances, FDA has adopted the Brix values established in the standards of identity for fruit products because they represent consensus values that are acceptable to both consumers and food processors.

Although the comment stated that there should be adequate data bases for orange juice and apple juice for statistical calculation to determine the minimum Brix value, no data bases for these juices were provided in the comment.

FDA agrees that a statistical analysis could be used to establish a Brix value for the single-strength juices. However, in the case of orange juice, the proposed Brix value of 11.8° for orange juice from concentrate is consistent with the Brix value established in the standard of identity for orange juice from concentrate (§ 146.145 (21 CFR 146.145)). In the absence of new data or information that demonstrates that the established Brix value is no longer representative of the soluble solids content of orange juice used to make frozen concentrated orange juice in this country, the agency has no reasonable basis to revise the Brix value for orange juice in new § 101.30(h)(1). A discussion on information received in comments on apple juice follows.

Because the Brix values represent minimum values, food processors are free to pack to higher soluble solids contents to meet consumers expectations when making juice products from concentrate. FDA points out, however, that should food processors use higher levels of soluble solids than is required by new § 101.30(h)(1) in reconstituting a juice to single-strength (100 percent juice) to meet consumer expectations for a sweeter juice, for example, FDA still considers the product to be 100 percent juice and not a higher percentage, such as 110 percent juice, when the additional soluble solids are the result of added juice.

23. Several of the comments cited the German RSK Brix values in support of the modifications that they suggested in the minimum Brix values listed in the July 2, 1991, proposal. One comment requested that these values be considered in establishing U.S. standards so as to achieve worldwide uniformity.

FDA agrees with the comment that the use of the German RSK Brix values may serve as useful guidelines in establishing Brix values in this country. The RSK values (termed Richwerte und Schwankungsbreiten bestimmter Kennzahlen or RSK–WERTE) are used by the German fruit juice industry as

reference points or guidelines for specified constituents in fruit juices. They assist food processors in determining whether fruit juices have been produced lawfully without adulteration. Factors influencing juice composition, such as growing region, variety, and production year, are considered in their establishment. Soluble solids content (Brix value) is one of the quality parameters defined by the RSK–WERTE guidelines. Other parameters include density, titratable acidity, sugars, acids, and amino acids. Mean values, standard values, ranges, and commentary are provided for each parameter.

A standard RSK value is usually a "minimum" or a "maximum" value, with data seldom falling above or below this value. In other words, the standard Brix value would be the minimum value in the range of values and not the mean or average Brix value. The mean RSK Brix value is not the arithmetic mean value but the value around which most of the values of industrially manufactured juice products congregate. RSK Brix values cited by the agency in this document are from "Adulteration of Fruit Juice Beverages," edited by S. Nagy, et al. (Ref. 7).

24. Several comments stated that the Brix calculation is only valid for juices to which sweeteners have not been added, and that other methods should be used to test for adulteration.

The agency agrees that the Brix calculation is only valid for juices to which sweeteners have not been added. Further, the Brix calculation to determine the percent juice content can only be used before sweeteners are added to the juice beverage in instances where the beverage is not 100 percent juice. The agency does not use Brix measurements by themselves to test for adulteration. Brix measurements can be used in conjunction with the results of other analytical methodologies and inspectional observations to support charges of product adulteration.

25. Other comments stated that the percent juice declaration should be calculated on weight/weight basis utilizing reference Brix levels because that is the manner in which the concentrates are sold.

The agency disagrees with these comments. The purpose of the regulation was not to prescribe how concentrates should be sold but to ensure that when reconstituted juice or juice from concentrate is used to produce a single-strength juice or a multiple-juice beverage, there is a standardized criterion for determining the percentage juice in the finished product. The standardized criterion allows consumers to make price and value comparisons across the range of juice beverages. Because the juice beverages are sold on a single-strength volume basis to the consumer, and percentage juice declaration is based on this standardized criterion, it would be inappropriate to utilize a weight/weight basis.

26. One comment requested that manufacturers be allowed to reconstitute concentrated juice back to the Brix in original expressed juice if the Brix of the expressed juice is known, and records are kept for the purpose of percent juice calculation and declaration. For example, expressed apple juice with a Brix value of 9.0° could be reconstituted and declared as 100 percent apple juice even though the Brix value provided by proposed § 101.30(j)(1) for 100 percent apple juice from concentrate is 12.5°.

The agency made an exception to the use of Brix values in calculating percentage juice for expressed juices because these juices have a naturally occurring range of Brix beyond the control of the manufacturer. Similarly, in consideration of existing industry conditions, the agency's decision to use Brix value for calculation of percent juice from concentrate was derived from the industry practice of commingling juice concentrates whose original Brix is unknown.

The agency differentiated between percent juice calculation for expressed juices and juice concentrates on the basis of industry practice and out of fairness to the expressed juice segment of the industry, which is subject to the vagaries of nature. While the agency does not object to reconstituting of concentrated expressed juice to the Brix level of the original juice if that Brix value level is known, the agency finds that once a juice has been concentrated, for the purpose of percent juice calculation and subsequent percent juice declaration, the Brix value as prescribed in the regulation must be used. Use of the same minimum Brix value level in labeling juice content for a specific juice from concentrate will enhance consumer comparisons between competing brands of that juice.

Therefore, the agency is denying the comment's request to reconstitute juice to its original Brix as expressed juice and declare it as 100 percent juice from concentrate although it does not have the minimum Brix value as prescribed in the regulation. This policy is consistent with Brix value requirements established in standards of identity for juice products made from concentrate.

f. Provisions to revise Brix values.

27. Many comments urged FDA to establish a mechanism to amend the table of Brix values because it may be necessary to include juices in the table that are not included now, and revised brix values may be needed in response to changes in technology, new crop varieties, and other matters.

The agency agrees that periodic amendments to the Brix value table will be necessary. However, the agency believes that adequate provisions exist in the regulation for citizen petitions, (§ 10.30). Therefore, the agency is not proposing any additional mechanisms to amend the Brix value table as adequate provisions already exist.

g. Individual juices.

28. Many comments submitted information to revise 1 or more of 13 proposed Brix values for various juices, such as apple, apricot, carrot, celery, cherry, grape, guava, lemon, orange, passion fruit, peach, pear, and raspberry (red). One comment submitted data to establish a Brix value for pomegranate juice.

i. Apple juice.

In the preamble to the July 2, 1991, proposal, FDA specifically requested comment on the proposed Brix value for apple juice, 12.5°, which the agency selected using values in the lower portion of the range of Brix values available to the agency (56 FR 30452 at 30459). NJPA had suggested that FDA adopt a Brix value of 11.0° for apple juice, based on USDA standards for grades (7 CFR 52.301 through 52.301) for U.S. Grade A apple juice.

Several comments contended that the proposed Brix value of 12.5° for apple juice is too high and urged FDA to adopt a Brix value of 11.0° as originally submitted by NJPA in comments to the agency in December 1989 and May 1990. In a comment on the July 2, 1991, proposal, NJPA stated that its suggested Brix value of 11.0° for apple juice reflects a consensus not only of NJPA's member companies but also of members of the National Food Processors Association (NFPA), with which NJPA coordinated the adoption of its December 1989 voluntary percent juice labeling policy. NJPA also pointed out that much of the concentrated apple juice used by its members is imported from foreign countries, and that any Brix value established should take into consideration the Brix value of juice produced in these countries. It noted that over 35 percent of all imported apple juice products during 1990 came from Argentina, and that the majority of the remainder came from European Community (EC) countries. According to the comment, there is no enforceable minimum Brix value requirement for

single-strength apple juice in Argentina but, in Germany and EC countries, the minimum Brix value for single-strength apple juice is 11.18°. The comment also noted that the Codex Alimentarius Commission has recommended a Brix value of 10.0° for reconstituted apple juice.

NJPA stated that Brix data from a major U.S. processor for juice expressed from apples grown in the State of Washington reflects an average Brix value of 11.58°, with a monthly range of 10.38° to 12.62° Brix (n=51) for two processing seasons (1989 to 1990 and 1990 to 1991). It claimed that similar data obtained from Michigan for the period November 1986 through November 1990 showed that monthly average Brix values ranged from 9.6° to 13.09°. The mean of the monthly Brix averages in Michigan for the 4-year period was 11.47°, with a standard deviation of 0.876°. The comment pointed out that the average Brix would have met FDA's proposed Brix value of 12.5° in only 6 months of the 4-year period, while the suggested Brix value of 11.0 would have been met in 26 months during the 4-year period. According to the comment, average monthly Brix values obtained from New York, for the period January 1987 through July 1991, ranged from a low of 9.5° to a high of 11.8°. The comment noted that, generally, juice from apples grown in the northwestern region of the United States has a higher average Brix and a lower acid content than juice produced from apples grown in the midwestern and eastern regions.

A comment from one firm noted that production records from their Austrian supplier showed that the Brix value of Austrian apple juice ranges from about 10° to 12° over the apple juice processing season. Another of the firm's suppliers provided information on apple juice from Germany, showing that in September the Brix value range of apple juice is from 9.8° to 11.0°, in October 10.5° to 11.5°, and in November 11.5° to 12.3°. It noted that most of the apple juice from Germany is processed during September and October. The comment recommended that FDA establish a minimum Brix value of 11.0° for apple juice. To establish a higher value, the comment added, would be to establish an artificially high Brix level that would impose an unfair trade barrier.

A comment suggested a minimum Brix value of 10.5° for apple juice. The comment noted that minimum Brix level for U.S. Grade B apple juice is set at 10.5° in the USDA standards for grades for apple juice (7 CFR 52.308). The comment maintained that the proposed Brix value of 12.5° would effectively exclude Canadian products from the U.S. market.

Other comments supported a Brix value of 11.5° for apple juice. One comment recommended a minimum Brix of 11.5° for apple juice reconstituted from apple concentrate, based on available data including records collected at 21 apple processing facilities, operated by 13 companies. According to the comment, the average Brix level reported by 17 of 21 plants fell in the range of 11.1° to 11.8°, with 11 of the plants reporting data in the 11.3° to 11.7° Brix range. Thus, the comment concluded, a Brix value of 11.5° is more representative of the Brix level of expressed apple juice than is the Brix value of 12.5° proposed by FDA.

Several comments contended that increasing the Brix value of apple juice to 12.5° would result in a Brix higher than normal for the expressed juices commonly used and would force food processors to produce a product that is incompatible with consumer expectations. They maintained that apple juice at a Brix of 12.5° is too sweet, especially in the Northeastern region where the taste preference for apple juice is a tart product (lower Brix/acid ratio). One comment stated that the proposed higher Brix value level of 12.5° would result in a 9 percent increase in soluble solids content over that of the currently marketed apple juice which contains from 11.0 to 11.5 soluble solids. It estimated that the increase would cost consumers of reconstituted juice products approximately $25 million annually. It further contended that the cost of some single-strength apple juice that contains added apple juice concentrate to achieve a preferred flavor profile would be increased as well if a Brix value of 12.5° is adopted. Another comment stated that changing the Brix from 11° to 12.5° would increase the ingredient cost by 14 percent and would further serve to put the product out of reach of many mothers who have been using apple juice for their babies.

After reviewing the data on the soluble solids content of apple juice submitted in the comments on the July 2, 1991, proposal, FDA has reconsidered its position regarding the proposed Brix value of 12.5° for 100 percent apple juice from concentrate. Data provided by industry in comments showed that mean Brix values for individual lots of apple juice range from 8.9° to 13.4°, with summary mean values (averaged monthly and yearly mean values) ranging from 11.0° to 11.58. NJPA pointed out that the minimum RSK Brix of apple juice is 11.18° and recommended that FDA adopt a minimum value of 11.0°. The agency notes, however, that the RSK mean Brix value for apple juice is 12.08°. With respect to the comment that requested that FDA adopt the minimum Brix of 10.5° for U.S. Grade B apple juice, FDA believes that this value is too low and does not reflect average Brix values of apples produced and processed in this country, as evidenced in the comments cited above.

In response to the comment requesting adoption of the USDA U.S. Grade A Brix value of 11.0° for apple juice, FDA points out that the USDA lowered the Brix value of U.S. Grade A apple juice from 11.5° to 11.0° in response to a request from the Processed Apple Institute (47 FR 5875, February 6, 1982). At that time, USDA stated that the change was being made to include differences in growing conditions in various parts of the country, increased use of more varieties of apples in the manufacture of canned apple juice, consumer preference for a less sweet product, and differences in processing techniques. However, comments summarized in the USDA rule noted that northwest apples have a Brix average of 12.5° or higher, to which USDA responded that the Brix requirements provided for in their standards for grades are minimum standards for each grade. It also stated that lowering the Brix by one-half of a degree will accommodate apple processors using varieties that have lower soluble solids compared with other varieties processed in other parts of the country.

FDA points out that the USDA standard (7 CFR 52.308), referenced by the comments, applies to canned single-strength apple juice, in which no more than one-fourth of the juice may have been concentrated. In the case of the USDA standard in 7 CFR 52.6221 et seq., for frozen concentrated apple juice, the minimum Brix value for a concentrate that is to be diluted 1 plus 1 is 22.9°. Such a product on dilution would have a Brix value of approximately 11.45°.

FDA acknowledges that there are differences in Brix values of apples depending on geographical growing regions, and that consumers may have developed certain preferences based on these regional differences. However, FDA believes that it should set the minimum Brix for apple juice at a level that is toward the middle of the range of Brix values for apple juice in order not to penalize producers of freshly expressed apple juice, which may have a higher solids content, to the benefit of those producers who sell reconstituted

or diluted apple juice products. It would also be fairer to consumers because they would be assured of getting reconstituted juices that more closely resembled the juice from which it was made. Consumers who prefer a less sweet juice can dilute the juice further by adding water. However, consumers who find that a reconstituted juice tastes weak because of a lower apple juice soluble solids content cannot rectify this condition by adding more apple juice solids.

Although most of the apple juice may be sold at Brix levels ranging from 11.0° to 11.5°, according to industry-based standards established by USDA, the agency believes that in establishing a minimum value for reconstituted apple juice or diluted apple juice, the minimum should reflect the average Brix value of expressed apple juice. Thus, consideration must be given to the higher Brix apple juice produced in the northwestern areas of the United States as well as to the lower Brix value juices produced in the midwestern and eastern areas. As noted in the July 2, 1991, proposal, a study by Mattick and Moyer (Ref. 2) of the Brix of 93 authentic apple samples collected from many different areas of the country and representing many apple varieties demonstrated average Brix values of 12.60°, 12.80°, 12.83°, and 12.74° (56 FR 30452 at 30459). The German RSK value noted in the comment provides for a range of Brix values from 11.18° to 14.01° with a mean Brix value of 12.08°. In view of these higher values, FDA believes that the minimum Brix value of 11.0° suggested by several comments from industry is too low, and that a minimum Brix value of 11.5° for apple juice is more appropriate because it takes into account the apples with the higher Brix values. Further, it is consistent with the Brix of reconstituted apple juice made in compliance with the USDA standard for grades for frozen concentrated apple juice. It also represents a value on the low side of the mean Brix value established for German apple juice, as well.

Accordingly, FDA has revised the minimum Brix value for apple juice by reducing it from 12.5° to 11.5°.

ii. Apricot juice.

FDA proposed a minimum Brix value of 14.0°, based on the data submitted by NJPA. According to NJPA, this value was derived from the USDA File code 147–A–2 (March 1988), Inspection of 50 percent Juice Drinks and Juice Drink Products under the Child Nutrition Labeling Program (Food and Nutrition Service).

One comment from a fruit and vegetable processing and marketing cooperative stated that their analyses of apricot juice over the period 1986 to 1990 showed an average Brix of 11.7° with a standard deviation of 0.8°. This average value was derived from a total of 502 measurements. The comment stated that it believed that the data were adequate because they include five different growing seasons, several varieties, and various weather conditions and cultural practices.

FDA notes that a National Canners Association report on the Brix values of authentic samples of apricots, as reported by Nelson and Tressler (Ref. 10), lists the Brix values of whole Blenheim apricots and Tilton apricots as ranging from 10.7° to 17.1°, with means of 14.1° for Blenheim apricots (n=6) and 12.6° for Tilton apricots (n=6). In this same reference, the Brix value of whole apricot pulp was 11.5°, and apricot nectar was 14.3° (n=6 in both cases). Thus, the Brix value of apricot juice appears to be dependent on the source of the extracted juice used in the analysis. Based on these data, FDA finds that the suggested Brix value of 11.7°, as provided in the comment, is reasonable. Use of the lower Brix value would permit use of an important variety, Tilton, which has a much lower Brix value than the proposed Brix value, 14.3°, from the canned nectars standard. In addition, the lower value would be representative of the Brix values currently encountered in industry as cited in the comment. Therefore, FDA is incorporating the Brix value of 11.7°, as suggested by the comment, in new § 101.30(h)(1) in place of the proposed Brix value of 14.3°. Because this amendment is based primarily on a single submission, FDA requests comments and data submitted in the form of a petition to amend this regulation if data are available that would support a different and more appropriate value.

iii. Carrot juice.

FDA proposed a minimum Brix value of 11.0° for carrot juice based on the NJPA Brix value submitted in December 1989. Subsequently, in May 1990, NJPA submitted a lower Brix value of 9.0° for carrot juice, based on data from NFPA. NJPA did not provide any justification as to why this value was more appropriate than the earlier submission. Thus, FDA published the Brix value of 11.0° because it was based on Government data rather than solely on industry practice. FDA specifically sought comments on the appropriateness of the proposed value and also requested justification for any suggested lower number.

Several comments were received on the Brix value of carrot juice that claimed that the proposed Brix level of 11.0° was too high. One comment provided 31 average Brix values (one average for each date of measurement) for the carrot juice produced during the period January 31, 1991, through June 12, 1991. The overall average Brix level from these data is 7.0° with a range of 5.4° to 8.0°.

Later, a trade association provided additional information concerning average Brix levels for carrot juice in a memorandum, dated January 22, 1992. This information consisted of the following: (1) An average Brix value of 8.6°, with a Brix value range from 7.0° to 9.3° and a standard deviation of 0.5°. based on 72 measurements, for the period of January 1, 1990, through December 12, 1990; and (2) an average Brix value of 8.1° with a Brix value range from 6.9° to 9.8° and a standard deviation of 0.5°, based on 39 measurements during the period of January 1, 1991, through July 31, 1991. No specific value was suggested for a minimum Brix for carrot juice in this comment.

A comment from a manufacturer of concentrated carrot juice recommended a Brix value of 8.0° for the reconstituted carrot juice. The comment provided information on daily average Brix value levels of freshly expressed carrot juice (each day's volume was between 30 to 50 tons) showing that: (1) The daily Brix average values (n = 31) ranged from 5.4° to 8.0° with an overall average of 7.0° during the period of January 31, 1991, through June 12, 1991, and (2) the average daily values (n = 20) ranged from 6.9° to 8.3° with an average of 7.6° during the period of October 1, 1991, through January 21, 1992. The comment stated that the firm has processed in excess of 3,000 tons of carrots for juice and concluded that the values submitted are indicative of the true Brix value of single-strength carrot juice.

Only two comments provided data on the Brix of carrot juice. The average Brix values from both sources and the industry recommended Brix are considerably lower than the proposed Brix of 11.0°. The Brix averages of the four data sets received are 7.0°, 8.6°, 8.1°, and 7.6°, with an overall average Brix value of 7.8°. The proposed Brix value of 11.0° was based on data from USDA Handbook 8–11, which lists 11.12 percent of total solids in canned carrot juice, of which 9.9 percent is total carbohydrate (Ref. 6). Because the Brix measures soluble solids content, and not all of the total solids or total carbohydrate content of carrot juice is expected to be soluble (e.g., insoluble cellulose or fiber), the use of these values as the Brix value would result in

a figure that is higher than would result from measurement of the Brix by refractometer. Therefore, based on this information, FDA is adopting the value of 8.0° in new § 101.30(h)(1). The Brix value of 8.0°, set out in the regulation below, was recommended by the manufacturer of carrot juice and is very close to the calculated overall average Brix in the data supplied to the agency in the comments.

iv. Celery juice.

FDA proposed to establish a minimum Brix value of 4.5° for celery juice based on the NJPA Brix value submitted in December 1989. Subsequently, in 1990, NJPA submitted a lower Brix value of 3.6° for celery juice, based on data from NFPA. NJPA did not provide justification as to why this value was more appropriate than the earlier submission. As in the case with carrots, FDA published the higher Brix value of 4.5° because it was based on Government data rather than solely on industry practice.

Two comments received in response to the July 2, 1991, proposal claimed that the proposed Brix value level of 4.5° for celery juice, based on NJPA's December 1989 submission to the agency, was too high, but these comments did not provide any data in support of the claim. One of these comments, from a trade association, stated that members had expressed concern over the proposed minimum level of 4.5°, and that it is soliciting data on levels for celery juice. However, no data were received on the Brix of celery juice from the trade association during the comment period.

A comment from a food processor recommended a Brix value of 3.0° for reconstituted celery juice. The comment stated that daily average Brix levels of freshly expressed celery juice, during the period of April 9, 1991, through May 10, 1991, ranged from 2.95 to 3.4° (n=10), with an overall Brix value average of 3.1°; and for December 23, 1991, the 1-day average Brix value was 2.64°. The mean of the 11 average Brix values is 3.09°.

NJPA suggested Brix value of 4.5° for celery juice was based on information from USDA Handbook 8–11, which reflects the total solids content of celery, and thus may be too high. The data on the Brix of celery juice from the food processor and NJPA's May 1990 submission also suggest that proposed minimum Brix value of 4.5° is too high. USDA Handbook 8–11 lists the total carbohydrate content of celery as 3.63 g/100 g (per edible portion), of which 0.80 g is crude fiber (Ref. 6). Thus, the soluble carbohydrates (sugars) content would comprise approximately 2.83 percent by weight. FDA recognizes that the other constituents may affect the Brix determination by refractometer, and that the use of the soluble solids, determined by difference, from Handbook 8–11 can only serve as a rough approximation. However, in view of this calculation and the data supplied by the food processor, both values supplied by NJPA appear to be too high for celery juice. Because neither NFPA or NJPA provided a basis for the Brix value of 3.6° for celery juice, FDA concludes that for the purpose of labeling the content of celery juice from concentrate that a more appropriate Brix value is 3.1°, based on the mean of the data submitted by the food processor. Therefore, FDA is revising new § 101.30(h)(1), accordingly.

v. Cherry juices.

FDA proposed a single Brix value of 14.0° for juice from both sour cherry and sweet cherry varieties, based on the data submitted by NJPA.

A comment from a firm that processes juice beverages stated that it has encountered large variations in Brix between the varieties of sweet cherries and sour cherries, and that the single-strength Brix values should reflect these differences. The comment maintained that the proposed Brix value of 14.0° is a compromise that does not reflect the actual situation for either cherry classification. In support of this contention, the comment included summary data from its U.S. supplier for dark sweet cherries and for red sour cherries obtained from the Pacific northwest.

Data from the supplier for the dark sweet cherries, collected during the years 1982 to 1990, showed a mean Brix value of 20.0°, a median of 19.9°, with a standard deviation of 3.0° (n=120) and a Brix value range from 14.0° to 30.0°. Using these data, the comment suggested that the minimum Brix value for dark sweet cherries be set at one standard deviation below the mean Brix value or 17.0°.

With respect to the red sour cherries, the comment supplied data for the years 1983 to 1990 that showed a mean Brix value of 15.8, a median of 14.0°, with a standard deviation of 3.4° (n=23) and a range from 11.2° to 22.9°. Using these data, the comment suggested that the minimum Brix value for sour cherries be set at one standard deviation below the mean Brix value or 12.4°. The comment also supplied data for five other mean Brix values or ranges for red sour cherries. These Brix values were for products obtained from Germany, Austria, and the United States, and ranged from a low Brix value of 10.0° to a high Brix value of 13.0°. This comment also pointed out that the German RSK Brix values (Ref. 7) for sour cherry juice are as follows: 14.71° mean Brix value, 12.36° minimum Brix value, and a Brix value range of 12.36° to 19.30°.

The comment also noted that food processors generally do not find that sweet cherry and sour cherry varieties are interchangeable in their beverage products.

FDA concurs with the comment that it should establish specific Brix values for sweet cherry and for sour cherry varieties because of the differences between the two types of cherries. Sweet cherries are higher in sugar and lower in acid than sour cherries. Accordingly, FDA has amended new § 101.30(h)(1) to reflect the differences, based in part of the data supplied by the comment.

In making this determination, FDA compared the suggested Brix value of 12.4° for sour cherries to data collected by FDA in 1962 (Ref. 11) for red sour pitted cherries that show a mean Brix value of 14.3° (n=15, std. dev. = 0.96° and range = 12.7° to 16.0°). FDA believes that the suggested Brix value of 12.4° may be too low in view of the FDA data, the median value of 14.0° cited by the comments and the RSK mean value, 14.71°. In keeping with establishing Brix values close to the mean Brix value, but in the lower portion of the Brix range, FDA believes that a more appropriate Brix value for sour cherries is 14.0°, as proposed. This value is slightly lower than the RSK mean value, the mean from the FDA data, and the mean value submitted by the comment. It is also consistent with the median value for sour cherries submitted in the comment. Therefore, FDA is retaining the proposed Brix value of 14.0° for sour cherries in new § 101.30(h)(1).

In the case of sweet cherries, FDA compared the suggested Brix value for dark sweet cherries of 17.0° (mean=20°, median=19.9°, std. dev.=3°) to data collected by FDA in 1962 on authentic sweet cherries (Ref. 11) that show a Brix range of 18.0° to 21.9° for sweet cherries (n=3). Because the mean values from the comment and the FDA data, as well as the median value supplied by the comment, cluster around 20.0°, the agency believes that the Brix value of 20° is more representative of the Brix value of sweet cherries than is the value of 17.0° suggested by the comment or the value of 14.0° for all types of cherries proposed by FDA. Therefore, FDA is modifying § 101.30(h)(1) to include a Brix value of 20.0° for sweet cherries.

FDA notes that the new Brix values are inconsistent with the single

requirement established for cherries in the standard of identity for fruit jelly, i.e., 14.3°, the reciprocal of the factor, 7, in § 150.140(b)(1) (21 CFR 150.140(b)(1)). The information that FDA has received suggests that there may be a need to revise the standard of identity for fruit jelly to reflect the separate values for the two classes of cherries, sour cherries and sweet cherries. In consideration of amending the standard of identity for fruit jelly, FDA requests information as whether substantial amounts of sweet cherries are being used in the manufacture of fruit jelly, and whether it should incorporate a specific value for sweet cherries in the standard.

vi. Coconut juice.

In the July 2, 1991, proposal, FDA stated that it has no data to support a specific Brix level for juice from coconut and requested comments on, and data for, an appropriate Brix level. The agency also noted that there are two portions of the coconut that can conceivably be used to produce a juice, i.e., the coconut water (liquid from coconut) and the coconut meat. FDA asked for information on the feasibility of using both portions of the coconut to produce juice and comments on whether there should be one or two Brix value levels for coconut.

According to one comment, there are no data to support a specific Brix value level for juice from coconut. The comment also noted that the method used for determining the Brix value of other juices may be inappropriate for use with coconut juice because of coconut juice's fat and oil content and their effects on refractometer readings. The comment stated that when data become available that might be useful to FDA in establishing a Brix or other value for determining what constitutes 100 percent coconut juice, it will submit such data.

In the absence of data on the soluble solids content of single-strength coconut juice, FDA is not establishing a minimum value for the food. Diluted or blended beverages made with coconut juice should be labeled with the percentage of coconut juice based on the content of the full-strength juice used. If made from coconut juice concentrate, the dilution should be based on the composition of the juice used in making the concentrate.

vii. Grape juice.

NJPA submitted a Brix value of 16° for grape juice in December 1989, based on information obtained from the Concord Grape Association. Subsequently, in May of 1990, NJPA suggested a lower Brix value of 13° based on the USDA File code 147–A–2 (March 1988). FDA proposed the higher Brix value of 16° for grape juice and solicited comments on the appropriate Brix level.

A comment from NJPA supported the proposed Brix value of 16.0° for grape juice. The comment stated that the higher Brix level for single-strength grape juice, recommended in its May 1990 comments, was based on comments it received from NFPA and the Concord Grape Association. NJPA stated that this level is the appropriate level.

A comment from a distributor and processor of juice products stated that in this country, no one in the industry is using a Brix level of 16.0° for grape juice, as set out in proposed § 101.30(j)(1), and urged that the final rule establish a minimum Brix level of 13.0° for single-strength grape juice. Citing two Federal regulations, the comment argued that FDA already recognizes 14.3° as the appropriate Brix value for grape juice in the standard of identity for fruit jelly in § 150.140, and that USDA uses a Brix value of 13° in the USDA standards for grades for frozen concentrated sweetened grape juice in 7 CFR 52.2460(b)(1) which, the comment maintained, is closer to reality.

FDA disagrees with this comment. The comment from the juice distributor cited the value for grape juice in USDA grade standard for frozen concentrated "sweetened" grape juice (7 CFR 52.2451 through 52.2464). FDA does not consider this Brix value to be applicable in defining the appropriate Brix for 100 percent grape juice. The USDA standard in 7 CFR 52.2452(a) states that not less than 50 percent of the total soluble solids of the finished concentrate shall be derived from Concord type grapes of the Labrusca species. In 7 CFR 52.2453, USDA requires a minimum Brix value of the finished concentrate including added sweetening ingredients to be 24.8° when the concentrate is made to be diluted 1 to 1 before consumption. The standard further states that in grading the prepared "grape juice beverage" from frozen concentrated sweetened grape juice, the Brix value of the beverage is not less than 13.0°. This "beverage" is the sweetened diluted grape juice product and thus is not relevant in determining the Brix of unsweetened, undiluted grape juice.

FDA notes, however, that the current USDA standards for grades for canned grape juice, in 7 CFR 52.1341–52.1351, list Brix values for two types of "unsweetened grape juice." Type I juice is from the Concord type grapes of the Labrusca species (slip skin varieties), and type II juice is from any type of grape other than the Concord type. The standard requires a minimum Brix value of 15.0° for both types of Grade A unsweetened grape juice and a minimum Brix value of 14.0° for both types of U.S. Grade B unsweetened grape juice. When the canned grape juice is sweetened, the minimum Brix value for each grade is increased by 2° to 17.0 and 16.0°, respectively (7 CFR 52.1350(a) and (b)).

The agency recognizes that much of the grape juice in the marketplace may have been sweetened or diluted because the strong and somewhat astringent flavor of freshly expressed grape juice may not appeal to some individuals. However, consumers have a right to know when the juice has been sweetened or diluted. Thus, FDA must establish a minimum Brix for the unsweetened full-strength grape juice to serve as the basis for the percent juice declaration on diluted juice beverages and reconstituted grape juice products.

FDA notes that the proposed Brix value of 16.0°, in accordance with the NJPA submission, was based on information from the Concord Grape Association. This value is also supported by information in the literature. Data reported by C.S. Pederson on grape juice support that the Brix value of the juice is around 16° for *Vitis labrusca* (Concord grapes) (Ref. 10). Average soluble solids levels for Concord grapes were 15.1, 16.4, and 16.7 for three regions in New York State in a 1949 publication by Robinson, et al., cited by Pederson (Ref. 10). The ranges for these three average Brix values were 12.9° to 17.8°, 13.1° to 19.5°, and 22.7° to 20.0°, respectively. Pederson also stated that nearly all grape juice prepared in the United States is from Concord grapes. The German RSK minimum Brix value for grape juice is 15.88°, based on a range of 15.88° to 19.30° and a mean of 17.03° (Ref. 7).

Based on these observations, FDA concludes that the minimum Brix value for grape juice should be at least 16.0°. Therefore, FDA is retaining the proposed Brix value of 16.0° for grape juice in new § 101.30(h)(1).

According to one comment, approximately 20 million gallons of 68 degree Brix grape juice concentrate (worth $130 million) is used annually in juice blends. The comment stated that because much of the juice is used at the 13° to 14° Brix level, an increase in the Brix level to 16.0° for purposes of juice percentage declaration, would have devastating economic effects. At an average cost of $6.50 per gallon, the comment claimed, this would represent a loss of $32.5 million which when passed on to consumers would become

much larger. The comment further stated that calorie conscious consumers will shy away from higher Brix juices in favor of others with lower Brix levels. Thus, a Brix value of 16.0° could also result in substantial losses in market volume that would be impossible to calculate.

FDA does not agree with the cost analysis in the comment. If the minimum Brix value is set at a higher level than food processors are currently using, food processors can still maintain the same diluted juice blend formulations. They simply will have to label the percentage of juice in the beverage appropriately.

viii. Grapefruit juice.

FDA proposed to adopt a minimum Brix value of 10.0° for grapefruit juice. This value was submitted by NJPA in December 1989 and is the same as that established in the standard of identity in § 146.132 (21 CFR 146.132) for grapefruit juice made from concentrated grapefruit juice exclusive of any added sweeteners.

A comment from a foreign government expressed support for a minimum Brix value of 9.0° for fresh or reconstituted grapefruit juice. The comment stated that this value would be consistent with the USDA standards for grades for unsweetened U.S. Grade A and U.S. Grade B grapefruit juice (7 CFR 52.1228, Table I).

FDA notes that the Brix value of 9.0° for fresh single-strength grapefruit juice is not applicable to "grapefruit juice from concentrate" (i.e., reconstituted grapefruit juice) in the United States or for use in calculating the percentage of juice contained in a juice blend in accordance with new § 101.30(h)(1). The standard of identity for grapefruit juice in § 146.132, as noted above, and the USDA standards for grades for grapefruit juice in 7 CFR 52.1228 (Table II, U.S. Grade A and U.S. Grade B), list a Brix value of 10.0° for unsweetened grapefruit juice from concentrate. The Brix value of freshly expressed grapefruit juice is not specifically designated in the standard of identity nor in the regulation (new § 101.30(h)(1)) set forth below. The Brix value for freshly expressed grapefruit juice is the Brix of the particular lot of grapefruit juice, before the addition of any water, sweetener, or any other additives, as determined by refractometer and corrected for acidity in accordance with § 146.132(a).

FDA is not revising the proposed Brix value of 10.0° for grapefruit juice because it was established by formal rulemaking (47 FR 43364, October 1, 1982). At the time that FDA adopted the standard, citrus processors and growers indicated that the preponderance of grapefruit juice produced in the United States contains, on average, 10.0 percent soluble solids or greater. Comments on the proposed standard of identity at that time also maintained that to establish a minimum soluble solids content of 9.0 percent would be to allow dilution of the finished product to a level substantially below that of the juice from the grapefruit fruit from which the concentrate is made. Therefore, FDA is adopting the 10.0° Brix value as proposed.

ix. Guava juice.

FDA proposed a minimum Brix value of 7.7° for guava juice, as suggested by NJPA. This value is consistent with the Brix value in the standards of identity for canned nectars (§ 146.113 and fruit jelly (21 CFR 146.140), the U.S. Customs Service requirements (19 CFR 151.91), and USDA File code 147–A–2 (March 1988).

One comment stated that using a statistical approach, it had calculated a standard Brix value of 6.6° for guava juice. The comment explained that its Brix data (mean of 7.1°, standard deviation of 0.5, a minimum of 6.0 and a maximum of 8.0°, median 7.1°, 20 data points, and mean minus 1 standard deviation to yield 6.6°) came from a single supplier of Hawaiian guava juice, who forwarded the weighted mean Brix values for each month's production. Using these data, the comment recommended a Brix value of 6.6° as the minimum level for a single-strength guava juice.

FDA has been unable to corroborate the suggested lower Brix value for guava juice in the published studies. FDA notes that one reference states that the Brix of guava averages around 9° (Ref. 12). Another reference lists soluble solids for the fruit from selected Hawaiian guava seedlings, which range from 8.0 to 11.5° Brix, and total soluble solids contents that range from 7.80 to 10.53 percent (n=10)(Ref. 10). In view of the published data on the Brix value of guava juice, FDA is adopting the proposed Brix value of 7.7°, which reflects FDA and U.S. Customs Service regulations, as well as USDA specifications. FDA recognizes that this value is higher than the mean and median in the comment's data, but the Brix published in the literature support a higher value than that suggested by the comment.

FDA is open to submission of information on the appropriateness of this value for 100 percent guava juice as a basis of a proposal to amend the standards of identity for fruit butter and fruit jelly. Any petition submitted to amend the fruit butter or fruit jelly standards (§ 150.110 (21 CFR 150.110)) and § 150.140) should be accompanied by data representative of the varieties of guava used in the manufacture of these products, as well as data on possible effects of factors such as maturity, growing conditions, and processing on the Brix of the fruit.

x. Orange juice.

FDA proposed a Brix value of 11.8° based on the requirement in the standard of identity for orange juice from concentrate in § 146.145. This value is also consistent with the Brix value submitted by NJPA.

A comment from a foreign government opposed the proposed Brix value of 11.8° for reconstituted orange juice and suggested a minimum Brix value of 9.7°. The comment stated that its suggested value would be consistent with the regulation in that country which establishes a minimum Brix value of 9.7° for orange juice (B.11.128 Food and Drugs Regulations, Canada).

FDA is not making the requested change. FDA notes that the Brix value of 11.8° set forth in new § 101.30(h)(1) for orange juice is the same as that established in the standard of identity for orange juice from concentrate in § 146.145. This value was established after a public hearing (28 FR 10900, October 11, 1963), by formal rulemaking, and represents a consensus of what interested parties believed to be appropriate at the time. A Brix value of 11.8° seemed reasonable and practical because it was equivalent to the approximate soluble solids content of reconstituted orange juice made in the home by consumers by diluting frozen concentrated orange juice. Frozen concentrated orange juice (§ 146.146 (21 CFR 146.146)) is generally made to 42° Brix and is diluted before consumption by adding 3 parts water, such that the resulting Brix value ranges from not less than 11.8° to 12.4°. FDA sees no reason for different values in the standard of identity for orange juice from concentrate and the regulation for defining "100 percent juice" for percent juice labeling purposes in new § 101.30(h)(1). Therefore, FDA is not revising the minimum Brix value of 11.8° for orange juice in new § 101.30(h)(1), as requested by the comment.

xi. Passion fruit juice.

NJPA suggested a Brix value of 12.0° for passion fruit juice based on the USDA File code 147–A–2 (March 1988). However, FDA proposed a minimum Brix value of 14.5° based on the Brix of passion fruit juice in the stayed canned nectar standard of identity (§ 146.113). FDA noted the variation in the two Federal specifications and expressed the

opinion that if there was justification for the lower suggested value, that it would be forthcoming in comments on the July 2, 1991, proposal.

A comment from NJPA stated that its original May 1990 suggestion of 12.0° as the minimum Brix value for passion fruit juice was based on a USDA data base, and that it has been unable to locate any other differing data except for the German RSK "guide" value for passion fruit juice of 13.5°. Noting that the FDA proposed Brix value of 14.5° was based on the canned nectar standard in § 146.113, which has been stayed for many years, the comment maintained that industry believes that the Brix levels contained in that standard are too high.

Another comment provided data obtained from its suppliers in 1990 on the soluble solids content of single-strength (unconcentrated) passion fruit juice from Ecuador (average Brix value of 14°) and Peru (Brix value range of 14° to 16°). The comment recommended that FDA adopt a minimum Brix level of 14.0° for the single-strength (100 percent) passion fruit juice.

FDA notes that the German RSK Brix value is based on a data range of 12.0° to 18.0° with a mean Brix of 14.0° and a standard value (minimum value) of 13.5°. Wallrauch, et al., (Ref. 7) stated that the data on passion fruit juice were based on extensive analyses of all industrially important varieties and provenances (South America, Africa, Australia, New Zealand, Fiji Islands, Sri Lanka, Taiwan, and Hawaii). It further stated with respect to the Brix of passion fruit juice, that only rarely and only for Brazilian juice has a Brix value for passion fruit juice been found to be as low as 11.5°. Wallrauch et al., also noted that a mean Brix value of 14° can be used in the dilution of concentrate to single-strength so as to maintain all of the organoleptic and analytical features of passion fruit juice.

FDA is adopting a Brix value of 14.0° for passion fruit juice based on the analytical data provided in the comments and supported by Wallrauch, et al. This value also is the same as the mean RSK Brix value reported by the German fruit industry (Ref. 7).

xii. Peach juice.

NJPA suggested a Brix value of 11.8° for peach juice which was published in the proposed § 101.30(j)(1). This Brix value is incorporated in the standards of identity for fruit butters (§ 150.110 (21 CFR 150.110)) and fruit jelly (§ 150.140) on September 5, 1940 (5 FR 3558) and in the standard of identity for canned nectars (§ 146.113) on May 7, 1968 (33 FR 6862) which was stayed because of objections on July 27, 1968 (33 FR 10713). It was based on the analysis of 33 authentic samples during the period 1924 to 1935 (Ref. 2). This Brix value is also used by the U.S. Customs (19 CFR 151.91) and by USDA in its specifications for its diluted juice products (USDA File code 147–A–2, March 1988).

One comment stated that its analyses of peaches over a 5-year period (1986–1990) showed an average Brix value of 10.5°, with a standard deviation of 0.9°. The average value was based on a total of 1,190 measurements. The comment recommended adoption of a Brix value of 10.5° in the final rule.

Based on its review of the data in the comment, FDA is adopting a Brix value of 10.5 as the minimum level for a single-strength peach juice because it is based on the data from over 1,000 samples obtained during a recent 5-year period. Thus, FDA has revised new § 101.30(h)(1) to reflect this minimum Brix value for peach juice.

FDA is open to additional information on the appropriateness of this value for 100 percent peach juice as a basis for a proposal to amend the standards of identity for fruit butter and fruit jelly. Any petition submitted to amend the fruit butter or fruit jelly standards (§§ 150.110 and 150.140) should be accompanied by data representative of the varieties of peaches used in the manufacture of these products, as well as data on possible effects of factors such as maturity, growing conditions, and processing on the Brix value of the fruit.

xiii. Pear juice.

NJPA suggested a Brix value of 11.0° for pear juice based on the USDA File code 147–A–2 (March 1988). FDA believed that this value may be too low and proposed a minimum Brix value of 15.4° based on the Brix value of pear juice in the stayed canned nectar standard of identity (§ 146.113). FDA noted the variation in the two Federal specifications and anticipated receipt of data in support of an appropriate Brix value for pear juice.

Seven comments stated that the proposed Brix value level of 15.4° for pear juice is unrealistically high. A comment from a university professor stated that it is common commercial practice to use a Brix value of 12.0° to represent single-strength pear juice. The comment stated that the RSK Brix values, which are widely applied as typical compositional indices for single-strength juice, list a Brix value range of 11.18° to 13.54° and mean of 12.13° for pear juice. According to the comment, pears are high in sugar content, even when harvested at the green and hard, but full-sized, stage of maturity. It noted that in one university study of changes in sugars and acids during the ripening of Bartlett pears, the data showed that green, hard pears contain 12.0 g of sugars per 100 g (12 percent) which increases to a maximum of 13.5 percent and then decreases to 12.4 percent at the fully ripe stage. The comment also stated that juice is easier to express from the green, hard fruit, and that processors often prefer to press at that stage of maturity. The comment reported a Brix range of 11.7° to 14.2° for pilot-plant processed pear juice (three varieties, unripe and ripened fruit, n=8). This comment did not recommend a specific Brix value.

One comment from a trade association stated that data from its members show that the proposed Brix value of 15.4° for pear juice is clearly excessive and recommended that the agency adopt a Brix value of 11.5° for pear juice from concentrate. According to the comment, the majority of pear concentrate is prepared from Bartlett pears. Other varieties may have a higher Brix, but they are normally marketed as fresh pears and have only limited use in the juice market. Therefore, the comment contended, other varieties should not be considered when establishing a minimum Brix level for pear juice from concentrate.

A comment from a juice products distributor provided data on unconcentrated pear juice that it collected from worldwide suppliers. The data included yearly average Brix values from Australia (1960), central and northern Argentina (1988 to 1991), and the northwestern United States (1988 to 1991). The overall weighted average Brix was 12.1° and the average Brix values ranged from a low of 10.5° to a high of 13.4°, with a standard deviation of 0.8°. Based on these data, the comment recommended that FDA adopt the Brix value of 12.2° as the minimum level of single-strength pear juice.

A comment from a fruit and vegetable processing and marketing cooperative stated that for the past 5 years, they have tested Brix levels in pear juice, and their results are much lower than FDA's proposed Brix value. The comment presented a summary of the data of Brix analyses for the years 1986 through 1990 (n = 2,446 measurements, mean Brix = 12.0°, and standard deviation = 0.8°). Based on these data, the comment recommended a Brix value of 12.0° as the minimum Brix level of single-strength pear juice.

One comment provided a summary of Brix data for more than 1,800 measurements on pear juice samples. The Brix averages for the last 3 years

were 11.7°, 11.6°, and 11.7°. The comment stated that many canners have been packing pears in pear juice for many years, and that the juice consistently runs between 11° and 12° Brix. No specific Brix level was suggested for the final rule.

A comment from a firm that imports apple and pear juice stated that data obtained from its research on pear juice suppliers in both the Northern and Southern Hemisphere showed that concentrate is produced from pears having a maximum Brix value not exceeding 12.3°, with a seasonal Brix value range of 11.3° to 12.3°. The comment recommended adoption of a Brix value of 11.0° for reconstituted single-strength pear juice.

One comment from a trade association expressed the opinion that a Brix value of 15.4° is too high and should be lowered. The comment cited a report showing that Brix values for unripe, fined Bartlett, Comice, and d'Anjou pear juice ranged from 11.7° to 14.1°, and that the majority of pear juice is produced from hard winter pears which generally average 11.0° Brix (Ref. 7). According to the comment, although some ripened Bartlett pears are juiced, they would have to be extremely ripe to approach even 15.0° Brix, and in that condition, they would be virtually impossible to press.

FDA agrees with the comments that a Brix of 15.4° for pear juice is too high. In proposing this value, which was based on the stayed canned nectar standard (§ 146.113), FDA acknowledged that the values had been challenged and specifically requested information on what values would be appropriate. NJPA's recommended Brix value of 11.0° was based on the USDA procedure for inspection of 50 percent juice drinks and juice drink products under the Child Nutrition Labeling Program (USDA file code 147§ A§ 2). According to USDA, this Brix value was recognized by industry as being appropriate in 1980. As far as this agency can determine, there is no identifiable data base that supports the USDA value.

Having reviewed the data in the comments, FDA concludes that the proposed Brix of 15.4° is not consistent with current commercial practice. The reported Brix values in the comments ranged from a low of 10.5° to a high of 14.1°. Industry recommendations for the minimum Brix value range from a low of 11.0° from a trade association to a high of 12.2° from a juice processor, with a mean recommended Brix value of 11.7°.

FDA acknowledges that the information provided consistently points to a lower Brix value for pear juice than the FDA proposed value of 15.4°. As stated above, however, one standard deviation below the mean is too low and is not in the best interest of the consumer. In this case, most of the data point to a mean Brix value around 12°. In fact, one comment recommended a minimum value of 12.2°, another 12°, and the university professor observed a Brix of 12.0° in his research. In addition, the German RSK "mean" Brix value is 12.13°. Use of a mean value of 12.0° would facilitate processing of pear juice which, according to the comments, is done most efficiently at the hard, green stage when the Brix of the juice is lower. Therefore, FDA is revising the minimum Brix for pear juice by lowering the level from 15.4° to 12.0°.

xiv. Pomegranate.

In the July 2, 1991, proposal, the agency solicited comments, as well as data, on any additional fruits and vegetables whose Brix values should be added to the final rule (56 FR 30452 at 30460). In response to this request, NJPA submitted data on the Brix value of pomegranate juice based on data from one of its members and suggested that a minimum Brix value of 16.0° be established as the Brix for 100 percent pomegranate juice. The suggestion was based on the firm's production records for the 1988, 1990, and 1991 processing seasons. Of the 257 samples taken during these seasons, the Brix values of samples ranged from 13.3° to 18.8°, with a weighted average of 15.9°. NJPA stated that the wide range in values is related to early season low Brix fruit versus late season high Brix fruit, varietal differences, and seasonal (climatic) variations.

FDA notes that the comment requested a minimum Brix value of 16.0° based on the firm's analyses over a 3-year period. FDA has an established Brix for pomegranate in the standard of identity for fruit jelly of 18.2°, expressed as the reciprocal by the designated factor of 5.5 for pomegranate (§ 150.140(b)(1)). This value was taken from data obtained before 1940 from authentic samples of pomegranates. According to USDA Handbook 8–9, pomegranates contain 17.17 percent total carbohydrate and 0.20 percent of fiber, or approximately 17.0 percent of sugars and other carbohydrate substances (Ref. 5). The agency recognizes that total carbohydrate content is only a rough approximation of the soluble solids content, and that other constituents of the juice may affect the refractometer readings.

Thus, FDA concludes that it is reasonable to adopt the comment's suggested lower value of 16.0° for pomegranate juice, which was based on actual analyses, instead of the higher value of 18.2° in the standard of identity for fruit jelly. In addition, the information from Handbook 8–9 suggests that a value lower than 18.2 would be more representative of the average Brix of pomegranate juice. Therefore, FDA is including the suggested minimum Brix of 16.0 for pomegranate juice in new § 101.30(h)(1) as set out below.

xv. Red raspberry juice.

In its 1989 submission of Brix data, NJPA suggested a Brix value of 9.0° for 100 percent red raspberry juice based on current industry practice. However, in evaluating the NJPA suggested value for red raspberry juice, FDA found that single-strength red raspberry juice can range between 5.6° and 10.7° (Ref. 3 at page 390). Other reports show Brix levels of 8.9°, 11.3°, and 10.8° (Ref. 3). Because these data (median value 10.7°) were not inconsistent with the Brix value set out in the standard of identity for fruit jelly (the reciprocal of the designated factor, 9.5, that equates to a Brix value of 10.5°) in § 150.140, FDA proposed a minimum Brix value for red raspberry juice from concentrate of 10.5°.

Four comments maintained that the proposed Brix value of 10.5° is too high for red raspberry juice. Two comments, one from a food processor and one from a trade association provided data on the Brix level for red raspberry juice obtained from three sources: (1) Lots of Pacific northwest red raspberries processed by the firm from 1985 to 1990 (mean Brix of 10.1°; standard deviation = 1.0°; n = 124); (2) 1988 European suppliers (mean Brix of 9.7°, standard deviation = 1.8, n = 16); and (3) 1990 European suppliers (mean Brix = 9.4°, standard deviation = 1.1°, n = 242). The comment from the food processor also included another compilation of seven average Brix values or Brix ranges provided by other juice suppliers from four countries (Austria—2 suppliers: mean Brix value of 8.5° and 6.3°; Belgium—mean Brix of 8.8°, with a range of 6.8 to 12.0°; Germany—Brix range of 7° to 8°; and United States—3 suppliers: Brix of 9° to 9.5°, 8.5°, and 8.5°). The comment also noted that the average RSK mean Brix value for raspberry juice is 8.7° with a range of 5.3° to 13.6°. Based on these data, both comments recommended a minimum Brix value of 8.4° for red raspberry juice.

Another comment, from a university professor, requested that the mean Brix values for red raspberry juice obtained from his research be considered in adopting a new standard. A statistical

summary of the Brix values resulting from the study are as follows: Mean of 9.95° (n = 41); std. dev. of 1.93°; and a range from 7.0° to 15.0°. The comment stated that if data for the underripe and overripe samples are excluded from the data base, the following summary values are obtained: mean of 9.50° Brix (n=26); standard deviation of 1.65°; and a range from 7.0° to 13.2°. Although the sampling protocol was not designed for the purpose of determining the "true" mean Brix value for single-strength red raspberry juice, the comment stated that these new data are relevant to the proposed regulations because the major commercial varieties from the Pacific Northwest and from Poland predominate in the sample set. Fall-bearing raspberries and several unusual varieties such as Golden are also included. The comment concluded that the proposed Brix level of 10.5° is too high and suggested that the 9.5° to 9.95° Brix values from the current research be considered in adopting the new standard.

One comment from a distributor of 100 percent fruit juice blends stated that the Brix value proposed by FDA for red raspberry fruit is incorrect and is not consistent with establishing a minimum acceptable value for a juice to be considered full-strength. The comment provided a brief summary of the Brix values collected from suppliers in northwestern United States (1990) and Europe (1991). It provided two average Brix values, 10.1° (range 9.0° to 12°) and 8.5° (no range provided) for the United States and an average Brix of 8.0° and a range of Brix values, 7.0° to 9.0° Brix for Europe, resulting in an overall average Brix value of 9.1° with standard deviation of 0.7°. The comment recommended 9.1° as the minimum Brix level of single-strength (100 percent juice) red raspberry.

FDA has reconsidered its proposed value of 10.5° Brix for red raspberries and agrees, based on the data submitted in the comments, that this value should be revised.

FDA also notes that soluble solids analyses conducted by the agency in 1964 and 1965 on five types of authentic red raspberries resulted in an average Brix of 8.91° (range 8.13° to 10.9° Brix; standard deviation 0.68°) (Ref. 14). In deciding to lower the proposed Brix value, FDA noted that most values cited in the comments tend to cluster between 8.5° and 9.7° Brix. Thus, FDA concludes that the suggested value of 8.4° is too low. The agency believes that a more appropriate minimum Brix value would be 9.2°, a Brix value in the lower portion of the range of suggested values provided in the comments. Accordingly, FDA has incorporated the value of 9.2° in new § 1.30(h)(1).

xvi. Other comments on specific values.

29. Several comments from the juice canning industry noted that FDA did not list any Brix values for beets, parsley, bell peppers, garlic, and onion. However, the comments did not propose any values or provide any information as to appropriate Brix values for these foods.

The July 2, 1991, proposal requested comments on, and data for, any additional fruits and vegetables whose Brix values should be added to the regulation. Because the comments provided no information or data, the agency is not placing these foods in the Brix value table. If a percentage juice determination is made for any fruit or vegetable juice not found in the Brix table in the regulation, the calculation for percentage juice declaration is to be made on the basis of the soluble solids content of the single-strength (unconcentrated) juice used to produce such a concentrated juice.

30. One comment proposed calculating the percentage juice at a Brix level equal to the average of the single-strength (unconcentrated) juice produced from that fruit in the United States.

Because the comment provided no data for the agency to review or evaluate, the agency cannot evaluate the comment's suggestion. Therefore, the percentage juice declaration will continue to be determined by using the Brix values in the table as revised in this final rule.

31. Several comments stated that acid correction of the Brix value in the calculation of percentage juice should be provided for certain juices, e.g., cranberry, lemon, lime, and raspberry as is currently provided in the standards of identity for grapefruit and pineapple juice (§§ 146.132 and 146.185 (21 CFR 146.185)). However, the comments stated that the methodology to do this correction at present is complex and not widely distributed. The comments suggested that Government and industry work together under the auspices of the Association of Official Analytical Chemists (AOAC) to determine the proper reliable methodology.

NJPA commented that the Brix values submitted by them in December 1989 and May 1990 were based on the assumption that the refractometric readings of Brix values were corrected for acidity to obtain the total soluble solids. They also stated that a footnote should be added to the table of values in new§ 101.30(h)(1), stating that the Brix value, if determined by refractometer, is corrected for acidity by the method set forth in the grapefruit juice standard. Another comment that supported the NJPA suggested Brix values recommended that a correction for acid content be applied in the Brix value determination for all juices, and that this correction be based on the predominant acid type inherent to the individual juice (e.g., corrected on a citric acid, malic acid, or tartaric acid basis). NJPA suggested that the predominant acid type be identified as part of new § 101.30(h)(1) to provide a clear and consistent means for the determination of the Brix values. A comment from another trade association also stated that any method used to calculate the Brix value level of the juice should provide for an acidity correction factor in determining the actual Brix value level.

FDA notes that the correction factors in the grapefruit standard are specific to citric acid. Yeatman, et al., developed two correction factors based on percent of citric acid to be added to the sucrose values obtained by the refractometer to yield true soluble solids and true Brix for grapefruit juice (Ref. 8). The data used to develop the correction factors were based on data collected by Stevens and Baier (Ref. 9) for citric acid content in citrus juice products. There are other predominant acids in fruit juices, but data, similar to that for citric acid, would have to be collected for these other fruit acids before a correction factor could be established.

Consequently, the above suggestions are not workable because these correction factors are applicable only to citric acid.

FDA notes that NJPA's list of Brix values cited references that predate the 1976 date of the Yeatman publication on the citric acid correction factors. In addition, Brix values for the fruit butter and fruit jelly standards were proposed in September 1940, and the fruit nectars standard was stayed in 1968. Thus, FDA does not believe that all of the proposed Brix values would have been corrected for acidity. The suggestion of a joint Government and industry effort to determine reliable methodology will be considered. Until acid correction factors are established for other juices, FDA will use the Brix values as specified in new § 101.30(h)(1).

32. One comment mentioned that FDA had not addressed the need for temperature correction when determining the percent soluble solids by refractometer.

FDA disagrees with this comment. The cited method of analysis (56 FR 36452 at 30458), published by AOAC, for determining the percent soluble

solids by refractometer includes a temperature correction (AOAC Official Methods of Analysis, 15th ed., 1990, sections 976.20 and 983.17).

33. Some comments stated that a "100 percent juice" claim should mean that only juice is present, and that no preservatives or other ingredients have been added. On the other hand, one comment stated that the percentage juice calculation should be a function of total juice solids in the final product, and that any added ascorbic acid, natural flavors, and acidulents should be treated as ingredients that do not affect the 100 percent juice claim as long as there are sufficient juice solids present to substantiate the juice content declaration. Another comment asked whether the Brix measurement included salt added to vegetable juices. It requested clarification as to whether adding salt to a 100 percent juice would prohibit declaration of the juice as 100 percent.

The juice content declaration is based on the percent by volume of single-strength (100 percent) juice in the product. It is intended to provide information on whether a juice is diluted and if so, by how much. For example, a declaration of 10 percent juice means one part juice plus nine parts water, 50 percent juice means 1 part juice plus 1 part water, and 100 percent juice means 1 part juice and no water.

Further, the agency recognizes that certain ingredients, such as salt, are used to affect flavor, and that others may be added, for example, as nutrients or as preservatives. In most instances, these additives, excluding bulky ingredients such as carbohydrate sweeteners, are not added in volumes significant enough to result in a diminution of the juice's soluble solids content and therefore do not affect the percent juice calculation. The juice products in the beverage must contain sufficient juice soluble solids to meet the minimum Brix level for 100 percent juice where established by regulation, before the addition of any non-juice ingredients, where such requirements have been established. For example, under the standard of identity for grapefruit juice, when the juice product is made from concentrate, and liquid sweeteners are added, the Brix value of the juice must comply with the required Brix of 10° (and corrected for acidity) exclusive of any added sweetener.

The agency believes that limiting the 100 percent juice declaration to juice beverages that contain no additives, such as vitamin C would discourage some manufacturers from producing beverages that contain such useful added ingredients.

However, FDA agrees that it is necessary to clarify the issue of a 100 percent juice declaration on a product that includes non-juice ingredients because it may be interpreted by some to mean the beverage contains juice and no other ingredients. The agency has advised repeatedly for a number of years that an unqualified 100 percent juice declaration on the principal display panel is misleading when the juice also contains non-juice ingredients (Ref. 16). The agency believes that the industry is already in substantial compliance with this policy. Particularly for a beverage made from only one fruit or vegetable juice, the "100% juice" declaration introduces a precision to the description of the product that can result in the consumer concluding that the juice is the only ingredient. Because an ingredient statement is required only if a product contains two or more ingredients the consumer would not likely look for an ingredient statement under these circumstances. A 100 percent juice declaration appearing on the information panel is not likely to similarly mislead the consumer because it is in reasonable proximity to the ingredient statement, so that it will be read by the ordinary consumer in conjunction with that statement under normal conditions of purchase. Similarly, if there is no information panel, and the principal display panel bears an ingredient statement, a 100 percent juice declaration would not likely be misleading. In addition, the agency recognizes that some of these products declare the presence of the non-juice ingredients as part of the statement of identity (e.g., "prune juice with added vitamin C").

Accordingly, FDA is requiring in § 101.30(b)(3) that for those products that do not declare the presence of the non-juice ingredient in the statement of identity, when a "100% juice" declaration appears on a panel of a juice beverage that does not also bear the ingredient statement, and the product contains a non-juice ingredient, the 100 percent juice declaration shall be accompanied by the qualifying phrase "with added ————," the blank filled in with the generic term "ingredient" or a term such as "preservative" or "sweetener." For example, a beverage blend containing 100 percent juice with an added sweetener in any or all the juices would bear the phrase "100% juice with added sweetener" when the declaration appears on a panel that does not also bear the ingredient statement.

Therefore, the agency is not granting the comments' request but is permitting a qualified 100 percent juice declaration on the principal display panel of 100 percent juice beverages that contain non-juice ingredients that do not significantly affect product volume, such as preservatives, provided that these ingredients do not result in a diminution of the juice soluble solids content or otherwise adulterate the beverage.

The agency advises that in this discussion, it is not evaluating the appropriateness of any of these low volume ingredients for addition to specific juices. Determinations of whether a substance is suitable as an ingredient in a food are beyond the scope of this rulemaking. This discussion addresses only the effect on the declaration of 100 percent juice of the presence of suitable ingredients that do not have a significant effect on product volume. Further, FDA advises that the presence of such ingredients in these beverages may require specific label declaration.

2. Juice Not From Concentrate

FDA proposed in § 101.30(k), (redesignated as new § 101.30(i)) that juices expressed directly from a fruit or vegetable, i.e., not concentrated and reconstituted, be considered to be 100 percent juice and be declared as "100 percent juice." Likewise, the percentage of expressed juice, and not Brix level, is to be used in calculating the percentage of juice in diluted juice beverages made directly from expressed juice. Therefore, FDA proposed in § 101.30(l) (redesignated as new § 101.30(j)) to require that calculations of the percentage of juice in a juice beverage made directly from expressed juice (not from concentrate) be based on the percentage of the expressed juice in the product computed on a volume/volume basis.

34. One comment stated that expressed juice products should not be excluded from the Brix method of calculating percentage juice. The comment expressed concern that if manufacturers were not required to meet a specified Brix level, some might dilute high solids content expressed juice with water to a lower Brix level and sell the product as full-strength (100 percent) juice.

As FDA stated in the July 2, 1991, proposal, diluting expressed juice to a lower Brix level but still calling it 100 percent juice would constitute adulteration and misbranding. Such a product would be misbranded under section 403(a) of the act because its labeling would be false and misleading

in that it failed to reveal the material fact that the juice was diluted. It would also be adulterated under section 402(b) of the act (21 U.S.C. 342(b)) because it had been diluted with water.

The agency discussed in the July 2, 1991, proposal that it was necessary to exclude expressed juices from the requirement for a single Brix level because such a provision would result in high solid content juice being diluted to the standard Brix level (56 FR 30452 at 30460). FDA stated that such dilution was not acceptable, and that expressed juice had to be declared as 100 percent with the solids content of the juice as expressed. The agency believes that the adulteration and misbranding provisions cited above will deter manufacturers from diluting expressed juice with water. Thus, FDA concludes that the concerns expressed in the comment are unfounded. Accordingly, as proposed, § 101.30(i) and (j) exclude expressed juice from the provision that percent of juice is to be calculated using specified Brix levels.

35. Another comment expressed concern that allowing expressed juice to have a different Brix value than juice of the same fruit made from concentrate could lead to organoleptic as well as nutritional inconsistencies in the product.

The agency recognizes that organoleptic as well as nutritional inconsistencies may be created by requiring that manufacturers of juice products that consist solely of expressed juice base their calculation of the juice content of the product on the juice as expressed rather than on a Brix level. The agency has concluded that Brix values are the best standardized criteria for calculating percentage of juice from concentrate primarily because of the industry practice of commingling large quantities of concentrated fruit juice, often from foreign sources, with differing and possibly unknown soluble solids values.

However, because the actual percentage of the source expressed juice is known, the percentage of expressed juice, and not Brix level, must be used in calculating the percentage of juice in full-strength and in diluted juice products made directly from expressed juice. Additionally, because the Brix levels of expressed juice from the same fruit or vegetable grown in different regions may vary within a large range, e.g., the Brix value for expressed apple juice ranges from 9° to 14°, it would be economically unfair to penalize producers of expressed juice from fruit or vegetables grown in regions that have a lower Brix value by not allowing them to declare 100 percent fruit or vegetable juice, when in fact the juice was directly expressed from the fruit or vegetable as it occurred in nature.

Also, FDA finds that consumers will not be misled by the differences between juices made from concentrate and expressed juices. While consumers expect juice from concentrate to be processed into a uniform product, they understand that expressed juice may vary because of variation in the fruit. For example, a particular brand of frozen concentrated orange juice will taste a the same from purchase to purchase, but fresh squeezed, home prepared orange juice will vary in sweetness and taste, depending on the maturity and quality of the oranges used to prepare the juice.

Therefore, the agency is finalizing the provision that juices expressed directly from fruits or vegetables be considered 100 percent juice.

36. One comment stated that the proposed method of calculating the juice content based on the Brix value was not applicable to blends of full-strength juice and concentrated juice because the total amount of juice in the product may be greater than 100 percent. The comment suggested that the final rule be amended to state that the Brix values are to be used for labeling purposes only when the product is a single juice beverage that is derived from concentrate.

FDA acknowledges that the total soluble solids content exceeds the minimum level necessary to declare that the juice is full-strength (100 percent) when concentrates are blended with single-strength juices. FDA does not intend that these products be exempt from declaration of the percent of juice. The agency recognizes that strongly flavored juice concentrates may be blended with single-strength juices to provide flavor and color in blended juice products. As a result, the total level of juice soluble solids in the blend will be greater than the total of such juices if the concentrate were diluted to single-strength before its use in the blend. In such cases, unless the blended juice is to be further diluted by the consumer, FDA considers a declaration of more than 100 percent juice to be misleading. Thus, the juice should be labeled as 100 percent juice. The agency has no objection to manufacturers making a truthful statement on the label concerning the actual level of juice soluble solids contained in the blend provided that it is made in a manner that is not misleading to consumers.

37. Several comments requested that the fruit component of nectars not be required to be declared as percent of fruit juice. They stated that pulp and puree are the fruit ingredients in nectars, not fruit juice. Comments suggested alternate fruit content declarations, such as "apricot nectar—contains 45 percent apricot pulp" or "————————percent fruit + juice." The comments expressed concern that consumers might be confused by a declaration, for example, of 100 percent juice on a beverage in which only two of the ingredients are declared as juice while the other two ingredients are declared as fruit puree.

The agency acknowledges that there is generally more fruit or vegetable fiber or pulp present in nectars than in juice, which is otherwise processed, clarified, or filtered. However, the Brix values listed in the July 2, 1991, proposal were calculated to take into consideration that some of the starting materials may be puree or pulp, e.g., banana, papaya, or guava. Further, many comments expressed support for the agency's position that standardized criteria are needed to facilitate consistency in calculating percentage of juice. The Brix concept for percent juice calculation, while not without limitations, is a standardized criterion and provides a consistent and equitable frame of reference for manufacturers in determining percent juice in beverages derived from concentrates. The agency is unaware of a comparable standardized criterion for fruit content as opposed to fruit juice content. Therefore, FDA rejects the suggested alternative percent fruit content declaration or declarations such as "contains 45 percent apricot pulp" or "———— percent fruit + juice" in lieu of the prescribed percentage juice content declaration based on Brix for nectars. However, the agency does not object to voluntary disclosure of such fruit component information provided that it is factual. These comments did not provide alternative standardized criteria for consistently determining fruit content in nectars or purees by themselves and in combination with other fruit juice in beverages as opposed to fruit juice content based on Brix values.

F. Modified Juice

The agency proposed in § 101.30(m) (redesignated as new § 101.30(k)) that if major modifications (i.e., changes in the color, taste, or other organoleptic properties) are made to a juice to the extent that the original juice is not recognizable, or if its nutrient profile has been diminished, then the juice may not be included in the total juice percentage declaration. However, in the July 2, 1991, proposal, FDA pointed out that it is appropriate to include in the

total percentage juice declaration juices with minor modifications, such as acid-reduced orange juice, that are easily recognizable to consumers (56 FR 30452 at 30461).

38. One comment suggested that the industry work with FDA to develop information and data that will provide normal ranges for the constituents in juice, such as minerals, acids, and sugars. Such data would be used to determine at what point in the process modification of the juice is beyond the normal range of these constituents. According to the comment, a project has been initiated to develop these parameters for apple juice obtained from sources throughout the world. Additional juices are to be added to the project in the future.

FDA is aware of this information development project and is providing guidance as to the kind of information that would be useful in making agency decisions. The agency encourages industry to develop data bases that would be helpful in establishing reasonable guidelines for juices, in particular, the levels and types of nutrients, ranges for these levels, and effects of processing on nutrient content. Such data bases would facilitate decisions that promote fairness to both consumers and the industry.

39. Several comments expressed concern that the description of major modifications in § 101.30(k) would not be interpreted appropriately. One comment stated that if the phrasing "if its nutrient profile has been diminished" is strictly interpreted, juice made from concentrate would be excluded from the juice content declaration. The comment explained that there is some difference in nutrient content in any juice that is filtered and concentrated. Some comments stated that the language of § 101.30(k) should be clarified by adding: "at the time processing is complete" after "recognizable;" and "to a level below the naturally occurring nutritional range for the juice" after "diminished," so that minor modifications of juices do not preclude the juice from being included in the percentage juice calculation and declaration. They cited as examples of such minor changes acid adjustments and removal of naringin from navel oranges to facilitate production of a more uniform product.

The agency agrees with the comments and is clarifying the provision because it was intended to address significant modifications of organoleptic properties and significant modifications of nutritional values. Significant modifications in organoleptic properties would include removal of the typical color, taste or flavor, or aroma such that the juice is no longer recognizable as the typical juice of the fruit or vegetable. In the case of nutrient content of modified juices, significant nutritional modifications would include decreases in the content of any essential nutrient that is present in a measurable amount (excluding fat or calories), i.e., present at a level of 2 percent or more of the Reference Daily Intake (RDI) for any vitamin or mineral listed under § 101.9(c)(7)(iv). However, FDA recognizes that some nutrient losses can be expected as a result of heat treatment, filtration, and clarification used to make the modified juice product. FDA expects that such losses would be minor, and that the resulting modified juices will provide levels of essential nutrients comparable to the naturally occurring nutritional range published in recognized data bases, such as the USDA Handbooks on Food Composition (Refs. 5 and 6), for the unmodified juice product.

The agency is adopting the suggested changes to the regulation with one exception. It believes that the term "normal nutrient range" is more appropriate than "naturally occurring nutritional range." As stated in the comment, the naturally occurring nutrient range, i.e., nutrient levels in expressed juice, may be slightly different from the range of nutrients normally present in juice that has been processed, for example, filtered and concentrated. FDA believes these differences should be taken into account in determining which changes in a juice constitute major modifications.

Accordingly, FDA has revised new § 101.30(k) by adding the phrase "at the time processing is complete" after "recognizable" and the phrase "to a level below the normal nutrient range for the juice" after "diminished," to specify that comparisons of the organoleptic properties of the original juice and the modified juice will be made "at the time processing is complete" and to specify that the nutritional profile must not be diminished "to a level below the normal nutrient range."

40. Some comments requested clarification of how the percentage juice content of dehydrated juices should be determined. One requested that dehydrated fruit and vegetable powders be treated similarly to fruit and vegetable juice concentrates, i.e., based on the Brix value, and therefore, the percent of juice should be based on the soluble solids content of the rehydrated product.

Another comment questioned the status of dry drink mixes which are prepared from spray dried juices that have not been modified in any way other than that the water has been largely removed. The comment expressed the opinion that when these products are properly reconstituted, they should be considered to be a juice.

FDA is not providing for the declaration of the percent of juice from dehydrated fruit or vegetable juices. At this time, the agency does not have information on the manufacture of such products or on the properties of the finished products with which to determine whether dehydration is a minor modification that does not significantly change the juice. The agency believes that many dehydrated juices may contain ingredients other than simply juice solids. Maltodextrins are often added to prevent stickiness during juice drying operations. Fruit essence or flavors may be added to compensate for volatile flavor components lost during processing. However, according to the literature, processes are being developed in which juices may be dehydrated without the addition of additives such as maltodextrins or glucose syrups (Ref. 15).

The agency requests information on how the specific dehydrated juices are made, so that it can determine appropriate means of labeling dehydrated juice products in juice beverages. Until such time as FDA can establish rules governing the declaration of dehydrated juices in juice beverages, it will evaluate the labeling of such dehydrated products on a case-by-case basis to determine if it is misleading. However, FDA advises that in the meantime, any declaration of percent of juice made on a rehydrated juice should be based on the fruit or vegetable solids before any other soluble substances are added to the product.

41. One comment stated that it is possible to remove some or most of the sugar from a juice and not otherwise change the nutrient profile of the juice. The comment stated that, with an alternative sweetener, the product will have the color, taste, and other organoleptic properties consumers associate with the original juice. The reduced-sugars juice will have levels of ascorbic acid, citric acid, and minerals that are equivalent to those of the standard juice. The comment maintained that an alternate method to the Brix calculation will have to be used in calculating juice content for such products. Thus, the comment suggested that the regulation recognize this possibility and permit manufacturers to use an alternative method to calculate

the juice content, provided they have data to substantiate the method.

FDA recognizes that current technology is such that sugars or other components may be removed from juice. The agency recognizes that the reduction of sugars from a juice or a standardized juice, and the subsequent sweetening of the juice with a sweetener that provides an insignificant amount of calories, results in a modified juice. If the juice is a standardized juice, e.g., orange juice, that has been reduced in sugars so that it qualifies for use of a nutrient content claim and complies in all other aspects to new § 130.10, then the product is a food defined by new § 130.10 and must be labeled accordingly. The actual name of the food will depend on its nutrient content. Similarly, if the original juice is not a standardized juice, it may qualify to bear a nutrient content claim defined in part 101.

However, as stated above, when sugars are removed, the resulting product is a modified juice and not juice. Therefore, like other modified juices, it cannot be included in calculating the percent juice in the product.

III. Common or Usual Name Regulation

The 1990 amendments require that the percentage juice declaration for fruit or vegetable juice beverages be on the information panel of the label. Accordingly, FDA proposed to delete from the common or usual name regulation for diluted fruit or vegetable juice beverages (§ 102.33) the provisions that deal with percentage juice declaration as a part of the name of the product and to amend the regulation to pertain only to how these beverages should be named. The agency also proposed changes in the provisions for naming diluted juice beverages. The proposed regulation included a requirement that the name of a beverage that contains juice but that is less than 100 percent juice include a qualifying term like "beverage," "cocktail," or "drink," to indicate that the product is not 100 percent juice. In addition, the agency requested comment on whether the term "diluted" should be required for these products. Further, the proposed regulation addressed such issues as how individual juices in a multiple-juice beverage should be declared, and how modified juices should be declared.

42. One comment requested clarification of the applicability of § 102.33. It noted that there were differences in phrasing in proposed § 102.33(a), (b), and (c) with respect to the products covered. It said that in § 102.33(a), FDA addressed diluted juice beverages by saying, "* * * beverage that contains less than 100 percent and more than 0 percent fruit or vegetable juice." On the other hand, in § 102.33(b) the product is described as a "diluted, multiple-juice beverage or blend of single-strength juices," and in § 102.33(c), as a "multiple-juice beverage or blend of single-strength juices * * *." The comment stated that it was clear that § 102.33(a) applies to dilute beverages and does not apply to nondilute beverages, but that it was not clear whether both § 102.33(b) and (c) apply to dilute and nondilute beverages, or whether § 102.33(c) applies only to nondilute beverages.

The agency advises that the difference in phrasing in § 102.33(b) and (c) was inadvertent. Both provisions are intended to apply to both dilute and nondilute beverages. Accordingly, § 102.33(c) has been revised to refer to a "diluted multiple-juice beverage or blend of single-strength juices."

A. Identity of Diluted Juice Beverages

The agency proposed in § 102.33(a) that if a product contains less than 100 percent juice and uses the word "juice" in the common or usual name, then the word "juice" must be qualified by a term that indicates dilution, such as "beverage," "cocktail," or "drink," appropriate to advise the consumer that the product is less than 100 percent juice. In addition, FDA requested comments on whether the term "diluted," or a similar term, should be required as part of the common or usual name for juices that are less than full-strength (100 percent) juice.

43. Several comments supported the July 2, 1991, proposal to qualify the term "juice" on products containing less than 1080 percent juice, and none objected. However, the majority of comments addressing the issue objected to a requirement for the term "diluted" in the name of beverages containing less than 100 percent juice. The comments stated that the term would give consumers the impression that the product was "watered down." On the other hand, several comments expressed the belief that the term "diluted" should be used. Alternatively, these comments suggested that if the term "diluted" is not used, a declaration of the total percent of juice should appear on the principal display panel if the beverage is not 100 percent juice.

The comments requesting that the term "diluted" be required did not provide information to demonstrate that such a declaration was needed or would be useful to the consumer. Consequently, the agency has no grounds on which to base such a requirement at this time. Therefore, in accord with most of the relevant comments, while requiring use of a term that indicates dilution, FDA is not requiring that the term "diluted" be included in the name of juice products that contain less than 100 percent juice and is adopting § 102.33(a) as proposed.

Further, the agency disagrees with the alternative suggestion to require total percent juice declaration on the principal display panel of the juice beverage if it is not 100 percent juice and does not bear the term "diluted." Percentage juice is required to be declared on the information panel, and, as discussed in comment 12 of this document, the agency does not have an appropriate legal basis for requiring an additional percentage juice declaration on the principal display panel.

44. One comment stated that soft drinks (sodas) that purport to contain real fruit juice should have a common or usual name such as "imitation grape drink." This comment said that such a name is applicable when a product named "grape soda" bears vignettes or words indicating the presence of grape juice.

The agency disagrees. Under § 101.3(e), a food is an imitation if it is a substitute for, and resembles another food, and is nutritionally inferior to that food. However, if the food is not nutritionally inferior to the food for which it substitutes, it is permitted to be labeled descriptively and need not bear the term "imitation."

The requirements for labeling a beverage as an imitation are not evoked by use of vignettes or words suggesting that grape juice is present. These vignettes or words would, however, make the beverage subject to the requirements in § 101.30 for declaration of juice content. The agency finds that such a product with a percent of juice declaration would be informatively labeled and would not be misleading. Accordingly, FDA is not requiring beverages which purport to contain fruit juice to be labeled "imitation" unless the criteria in § 101.3(e) are met.

B. Identity of Multiple-Juice Beverages

FDA proposed to require in § 102.33(b) that if a product is a diluted, multiple-juice beverage or a blend of single-strength juices and declares, names, implies, or represents on the label, other than in the ingredient statement, one or more of the individual juices (represented juices), then the names of the represented juices must be included in the common or usual name in descending order of predominance by volume, unless the common or usual

name specifically shows that the juice with the represented flavor is used as a flavor (e.g., raspberry-flavored apple and pear juice drink).

In the July 2, 1991, proposal, the agency noted that blends or mixtures of several juices, with one or two juices present in only minor amounts giving them flavor, are difficult to label (56 FR 30452 at 30462). Therefore, FDA did not propose an exact labeling format for such products. The agency proposed in § 102.33(c) that if a diluted multiple-juice beverage or blend contains a represented juice and one or more that are not represented, i.e., not named or implied through words or vignettes other than in the ingredient statement, then the common or usual name for the product must state that the nonrepresented juices are present (e.g., "Raspcranberry: raspberry and cranberry juice in a blend of two other fruit juices").

45. Comments addressing the issue of which juices should be declared in the common or usual name when more than one juice is present in the product were markedly different. Some comments asserted that all juices (represented and nonrepresented) should be included in the common or usual name because consumers may be confused when the common or usual name reflects certain juices and the ingredient statement declares additional juices. One of these comments disagreed with FDA's proposed position that it was appropriate to exclude from the category of represented juices (and consequently from the requirement for declaration in the name) those juices whose presence in the product is disclosed only in the ingredient statement. The comment stated that the agency had offered no legal justification for this position. The comment provided no justification for its position that the presumption should be that juices declared only in the ingredient list are "represented."

Other comments stated that it would be unreasonably cumbersome for products that include many juices to list them all in the statement of identity. They said that the combination of a truthful, descriptive statement of identity, the ingredient list, the percentage total juice declaration and, optionally, a vignette would provide enough information about the juices present.

The first comments are not persuasive. The agency stated in the July 2, 1991, proposal that because all ingredients of a product must be declared in the ingredient statement, if the criteria for what is a "represented juice" included being listed anywhere on the label, all juices would be considered to be represented (56 FR 30452 at 30456). FDA stated that it was more appropriate to exclude juices listed only in the ingredient statement from the category of represented juices, so that a distinction can be made between those juices represented as being present in the product, through word or vignette, and those not so represented. The comment did not provide any information that would justify different position.

The basis for the agency's position is provided by the basic principles for common or usual names in § 102.5. It is not necessary to list all juices in the name of a beverage to adequately describe the product. The basic nature of the product can be described in various ways, e.g., as a blend of five juices, with a declaration of the name of the juice or juices that provide the characterizing flavor, as long as it is clear from the name that other juices are present. Under sections 201(n) and 403(a) of the act, the name of the food must not omit any material facts. The names of all the juices in the five-juice beverage example, however, are not necessarily material facts in this context. Consequently, FDA concludes that its position that a juice whose presence in the product is disclosed only in the ingredient list of a beverage product is not a "represented" juice is appropriate and consistent with the act.

The agency also concludes that it is not necessary to require that each juice in a beverage be named to ensure that the label is not be misleading. As discussed in the response to comment 10 of this document and in response to subsequent comments, there are several ways in which a multiple-juice beverage can be appropriately labeled. For example, for a product containing apple, grape, raspberry, and cranberry juice, the names "Raspberry and cranberry flavored juice beverage in a blend of two other juices" or "Raspcranberry; Raspberry and cranberry juice beverage, 10 to 15 percent cranberry juice and 3 to 8 percent raspberry juice" would be acceptable under the act.

However, while FDA is not requiring that each juice in a beverage be declared in the name of the product, it encourages such declarations. They may provide useful information for the consumer, provided that the declaration does not misrepresent the contribution of any individual juice to the product.

46. One comment suggested that for a multiple-juice beverage, the principal display panel should display by words, vignette, or other means each juice ingredient or the number of juices in the beverage. It stated that such a requirement would remove the need to distinguish between represented and nonrepresented juices and would assure clarity and uniformity in labeling.

The agency agrees that such labeling would be informative and encourages manufacturers to identify on the principal display panel each juice ingredient or the number of juices in the beverage. FDA is not convinced that it is necessary or appropriate to limit label declarations for all multiple-juice beverages to those described in this comment because there are other ways to adequately name these beverages. The agency has provided in response to other comments in this document, examples of other nonmisleading ways to name a multiple-juice beverage. Consequently, FDA is not adopting the requested requirement.

47. A number of comments objected to the requirement in proposed § 102.33(b) that each juice represented on the label be named in the statement of identity in descending order of predominance by volume. Some suggested that where all juices in a multiple-juice beverage are depicted in a vignette, naming all those juices in the common or usual name would not provide significant benefit to the consumers. They said that instead, naming all such represented juices would require excessive label space. A number of comments stated that in those instances where a blended juice product includes a juice that imparts the predominant flavor but that does not predominate by volume, the declaration of the name of the prominent or characterizing juice flavor should be made first, rather than being declared in order of predominance by volume, because the consumer needs to know the flavor to be expected in the product.

The agency has evaluated these comments and others discussed below and is revising the provisions of new § 102.33(b) so that it does not require declaration of all represented juices in the common or usual name of the beverage. Consistent with the approach discussed in response to comment 10 of this document, FDA concludes that while beverage labels are clearly misleading if they misrepresent the contribution of one or more individual juices to the nature of the product, not all multiple-juice beverage labels that bear representations of individual juices misrepresent their contribution to the total product. For example, a vignette that depicts all the fruits or vegetables in the product may not misrepresent the contribution of an individual juice to the nature of the product. Accordingly, the agency has revised new § 102.33(b) to clarify that all represented juices need not be named. In addition, FDA is

retaining the provision that juices that are declared in the name must be in descending order of predominance by volume unless the name specifically shows that the juice with the represented flavor is used as a flavor (e.g., raspberry-flavored apple and pear juice drink). The name of the characterizing juice may therefore be declared first although it is not the most predominant juice. However, as discussed below, this provision does not relieve the manufacturer of the obligation to label the product in a truthful and nonmisleading manner. The agency believes that this revision of new § 102.33 along with the others discussed below are adequate to prevent misleading labels on multiple-juice beverages.

48. Several comments supported proposed § 102.33(c), which states that when the represented juice is not the only juice present, the common or usual name of a multiple-juice beverage should reflect that fact. No comments objected. The agency is therefore retaining this provision. However, given other changes in the final regulation, FDA has used a different example to illustrate the requirement, so that there will not be confusion as to the completeness of the name provided in the example.

49. One comment noted the requirement in § 101.22(i) that the term "flavor" or "flavored" accompany the name of certain foods containing added flavors. The comment requested that juice products labeled as "———— flavor" be exempt from common or usual name requirements in proposed § 102.33. It requested clarification with respect to naming a diluted juice product containing three juices (cranberry, grape, and lemon) and a juice flavor (cranberry flavor). This comment stated that § 101.22(i)(1)(iii) requires such a product to be labeled as "cranberry flavor," however the proposed regulations in § 102.33 require the statement: "in a blend of ———— other juices." The comment stated that requiring this statement is not reasonable because the term "cranberry flavor" adequately informs the consumer in accordance with § 101.22, and the percent total juice and percent cranberry juice would be on the information panel.

The agency advises that an acceptable description of the product described in the comment would be "cranberry flavored juice in a blend of two other juices." Another adequately descriptive term would be "cranberry juice in a blend of two other juices, with added cranberry flavor." The agency has not specified the precise wording that must be used as the name of such a beverage. However, both §§ 101.22 and 102.33 are intended to ensure that the label communicates essential information to consumers. These provisions are intended to provide manufacturers with flexibility for labeling products while providing consumers with information that they need to determine the nature of the product. The agency concludes that both kinds of label information discussed here are essential to adequately describe the nature of the product. One type of information informs the consumer when flavoring substances have been added to the product. The other type describes other aspects of the basic nature of the product. Thus, FDA is not making the requested revision.

In addition, the suggestion in the comment included mandatory declaration of the percent of cranberry juice in addition to percent of total juice. As discussed in comment 10 of this document, declaration of percentage of individual juices represented on the label is not required as a part of the juice content declaration under this final rule. Therefore, not all the label information discussed in the comment's alternative approach will be required on the product.

50. Some comments that objected to mandatory declaration of the percentage of each individual juice represented on the label of a multiple-juice beverage suggested alternatives in the form of labeling schemes centered around the common or usual name of the product that they said would adequately describe multiple-juice beverages. These label schemes included statements of identity that: name the characterizing juice where needed to provide information on taste or flavor of the product; where appropriate, declare that the product was prepared from concentrate; and include terminology like "blended" or "blend of juices" to convey the multiplicity of juice ingredients. In addition, declaration of the presence of added flavors in accordance with § 101.22(i) would be required. The comments said that this information, together with the percentage of total juice and declaration in the ingredient list of all juices (or juice concentrates) in descending order of predominance by weight, would provide the consumer with sufficient information to make a product selection.

The agency agrees that the labeling schemes suggested by the comment would provide adequately descriptive labeling for some products and, as discussed in other comments, is requiring in the final regulation the declarations suggested. However, it does not agree that this scheme would ensure that all multiple-juice beverages would bear labels that are not misleading.

As discussed above, FDA finds that it is not necessary that all multiple-juice beverages identify each represented juice in the name of the product and declare the percentage of each represented juice. The agency has given examples of label statements that would not be misleading. However, FDA is not persuaded that the recommended schemes would ensure the labeling of multiple-juice beverages in which the named juice is not the predominant juice would provide enough information to describe the product for the consumer. FDA agrees with those comments that expressed concern that consumers are being misled into believing that named juices are present in greater amounts than is actually the case. The agency is aware of a number of products currently on the market for which the suggested labeling would not inform the consumer that the named juice is present in only a minor amount.

The agency notes that the regulation on the general principles for common and usual names provides in § 102.5(b) (21 CFR 102.5(b)) that when the proportion of a characterizing ingredient in a food has a material bearing on price or consumer acceptance, or when the label or labeling or the appearance of the food may otherwise create an erroneous impression that such ingredient is present in an amount greater than is actually the case, the percentage such characterizing ingredient shall be declared as a part of the common or usual name of the food. This provision formed the basis for the requirement in the previous version of § 102.33 for declaration of percent of juice, both for total juice and for each individual juice represented on the label.

FDA agrees with comments that stated that declaration of the percentage of individual juices will provide informative labeling. While the agency has decided not to require percentage declaration of represented individual juices in all multiple-juice beverages, it concludes that for multiple-juice beverages that name one or more but not all of the juices present other than in the ingredient list, there is great potential for the label to misrepresent the contribution of the named juice to the product. When the named juice is the predominant juice in the product, FDA considers that the consumer will not be misled with regard to its contribution because naming it will not over emphasize its contribution. However, when the named juice is not the predominant juice, the consumer can be

misled. Therefore the final regulation, in § 102.33(d), requires that the common or usual name of the product specifically describe the contribution of the named juice if it is not the predominant juice. The agency has provided two ways for the common or usual name to include this information.

In § 102.33(d)(1), the agency has provided that manufacturers can use a product name that identifies the juice that provides the characterizing flavor and specifically shows that that juice is used to flavor the product (e.g., "raspberry flavored apple and pear juice drink" or "apple and pear juice drink flavored with raspberry juice"). The agency believes that using the term "flavor" with the name of the characterizing juice will inform the consumer that the juice is present in an amount sufficient to flavor the beverage but will not imply that the content of that juice is greater than is actually the case. This alternative is consistent with the agency's approach of not requiring percentage total juice declaration for bottled waters that contain juice for flavoring in small amounts (usually less than 2 percent) (see comment 4 of this document). Accordingly, FDA is providing in § 102.33(d)(1) that a multiple-juice beverage may use a product name that specifically shows that the named juice is used as a flavor.

Alternatively, consistent with § 102.5(b), the agency is providing in § 102.33(d)(2) for the declaration of the amount of the named juice in multiple-juice beverages that name one or more but not all of the juices in the product. As explained in the Federal Register of March 14, 1973 (38 FR 6964), the disclosure of the amount of a characterizing ingredient is a material fact.

Among the reasons given in comments that disagreed with the proposed requirement for declaration of percentage of individual juices was the need to have flexibility in the formulation of the beverage to accommodate variations in raw material juices and price changes. The comments included a report that documented that changes in formulation occur frequently and in a significant number of products. The agency is persuaded by the comments that an accommodation is warranted. It agrees that declaration of individual juice content in 1-percent increments is not practicable. Accordingly, FDA is providing in § 102.33(d)(2) that the juice content declaration of individual juices may be made using a 5 percent range, e.g., 2 to 7 percent raspberry juice or 5 to 10 percent cranberry juice. The agency considers that a 5 percent range is large enough to provide for changes in formulation for juices that are present in small amounts.

Comments did not provide specific information on individual juice content, but it is reasonable to assume that a minor juice in a multiple-juice beverage would not be present at greater than about 25 percent of the total product. The 5 percent range is one-fifth of this amount. The agency concludes that a 5 percent range would provide this kind of flexibility to accommodate minor fluctuations in amounts of juice needed to compensate for differences in raw material. In addition, some comments contended that declaration of percent of individual juices in 1-percent increments constitutes an inappropriate disclosure of proprietary formulation information. The agency believes that declaration of individual juice content in 5 percent ranges would in any case not reveal the product formula. Finally, the 5 percent range declaration will provide enough information for consumers to be able to understand the contribution to the product made by the named juice and not be misled into believing that the juice is present in an amount greater than is actually the case.

Accordingly, FDA has provided these two labeling alternatives for multiple-juice beverages that name one or more but not all of the juices in the product in new § 102.33(d). In addition, the final regulation requires in new § 102.33(d) that the percent individual juice declaration be a part of the name of the product and meet the type size requirements in § 102.5(b)(2).

51. Several comments stated that juice beverages may be made from dehydrated as well as fresh fruits and vegetables in products such as vegetable cocktail, vegetable juice cocktail, juice cocktail, and bloody mary mix. One comment requested clarification that the names "vegetable juice cocktail," "vegetable cocktail juice," and "vegetable cocktail" can be used interchangeably on such products, when they are made from any combination of expressed juice, juice concentrate, and dehydrated fruits and vegetables.

The agency does not have information with which to determine whether beverages made from dehydrated fruits or vegetables differ from beverages made from concentrated or expressed juice. The agency welcomes any data or other information on the nature of beverages made from dehydrated fruits and vegetables, particularly on how they differ from beverages made from expressed or concentrated juice. The agency advises that it will evaluate the labels of such products on a case-by-case basis to determine whether the labeling is misleading. However, FDA advises that irrespective of the form of the vegetable ingredients, the term "vegetable cocktail juice" may not be interchangeable with the other two terms. It uses the word "juice" without a term indicating dilution. Accordingly, it can be used only on beverages that are not diluted juice products. The terms "vegetable juice cocktail" and "vegetable cocktail" would apply to diluted vegetable juice beverages.

C. Vignettes

The agency did not propose a specific requirement regarding the relative amounts of the various fruits depicted in a label vignette but solicited comments on whether it should require that the vignette accurately reflect the quantity of the fruit present or the taste of the product, or whether some other requirement is appropriate.

52. Some comments, from both consumers groups and manufacturers, stated that vignettes should depict all juices in a product. Other comments stated that such a provision is not necessary because a descriptive name together with declaration of each juice by order of predominance in the ingredient list and the percent of total juice would provide enough information to ensure that the consumer is adequately informed.

The agency agrees that it is not always necessary that the label of a multiple-juice beverage depict each juice in a vignette. The agency believes that a vignette that pictures only some of the fruit or vegetables in the beverage would not be misleading where the name of the food adequately and appropriately describes the contribution of the pictured juice. For example, for a 100 percent juice product consisting of apple, grape, and raspberry juices, in which the raspberry juice provides the characterizing flavor, a vignette depicting raspberries would not necessarily be misleading if the statement of identity were "raspberry juice in a blend of apple and grape juice." Similarly, the vignette would not be misleading if the beverage were named "raspberry flavored fruit juice blend" or "raspberry juice in a blend of two other juices, 3 to 8 percent raspberry juice." Moreover, if these three juices were in a beverage containing 50 percent total juice, a vignette picturing raspberries would not be misleading in the presence of a name like "raspberry flavored juice beverage."

Accordingly, FDA is not requiring that vignettes depict the fruits or vegetables for all juices present. However, FDA believes that a vignette that pictures the fruit or vegetable

sources of all juices present in a product would provide useful information and thus encourages manufacturers to use such vignettes.

Conversely, vegetables or fruits not present in the beverage cannot be depicted in vignettes or other pictorial representations on the label. The agency considers that depicting a fruit or vegetable in a vignette on a juice beverage implies that the fruit or vegetable is in the product, either in the form of a juice or of a natural or artificial flavor of the depicted fruit or vegetable. A vignette that pictures a fruit or vegetable that is not present in the product results in a label that is false and misleading and therefore in violation of section 403(a) of the act.

53. Some comments that wanted all fruits and vegetables pictured in the vignette also requested that the fruits and vegetables be depicted in proportion to the amount of each juice present. However, most comments requested that the agency not impose a specific requirement regarding the relative amounts of the various fruits or vegetables because the relative size and shape of various fruits and vegetables make it difficult to portray by vignette. They stated that both the relative size and the quantity of those fruits and vegetables are difficult to represent in a manner that would allow the consumer to readily recognize the quantity relationship.

The agency did not propose a specific requirement regarding the relative amounts of the various fruits depicted in a vignette but solicited comments on whether it should require that the vignette accurately reflect the quantity of the fruit present or the taste of the product, or whether some other requirement is appropriate. While information in comments emphasized the difficulties in displaying fruits and vegetables quantitatively, there was no information on how useful quantitative displays could be devised. The agency, therefore, is not requiring that fruits and vegetables pictured in vignettes be depicted in proportion to the amount of each juice present.

54. Several comments requested that the agency not make specific requirements regarding flavor characterizations in vignettes. They stated that the taste of a product is best communicated to the consumer through means other than the label vignette alone, and that any requirement should rely on wording to describe product flavor, e.g., "raspberry (flavor) in a blend of ———— other juices."

The agency agrees with the comments that vignettes alone should not be required to communicate the flavor characteristics of the beverage and is not establishing such requirements. It also agrees that more explicit information is provided by the wording on the label, especially in the statement of identity of the product. However, FDA advises that in order for a beverage label to not be misleading, it is necessary that the vignette and other label statements on the beverage not conflict in any way. The agency has discussed above the circumstances under which the name of the beverage may be misleading. It will determine on a case-by-case basis whether a vignette is misleading because it is not consistent with other label information or for other reasons.

D. Modified Juices

In the July 2, 1991, proposal, the agency stated that the consumer must not be misled as to the nature of the juices used to make a juice or diluted juice beverage (56 FR 30452 at 30461). FDA stated that the appropriate common or usual name for a modified juice or a beverage containing a modified juice should be determined by the nature and extent of modification. For example, the appropriate common or usual name for frozen orange juice concentrate in which the acid content is reduced is "reduced acid frozen concentrated orange juice" (21 CFR 146.148).

However, FDA also acknowledged that beverages may contain modified juices that are markedly altered and added to beverages to increase the declared juice content but are actually "stripped" juices, i.e., juice derived, rather than sugar derived, sweetening ingredients, e.g., deflavored, decolored white grape juice.

The agency proposed in § 102.33(d) (redesignated as new § 102.33(e)) to permit a juice that has been modified to be referred to by a common or usual name that includes the word "juice" so long as the exact nature of the modification is specified in the common or usual name. The description of the modification would therefore appear as part of the name wherever it is used.

Further, the agency proposed that a product would be misbranded if a label vignette depicts the source fruit or vegetable of a juice whose color, taste, or other organoleptic properties have been modified to the extent that the original juice is no longer recognizable, or if its nutrient profile has been diminished.

55. One comment suggested three classifications for juice as the basis for developing labeling policy for modified juices:

First, minor modifications that do not alter the basic characteristics of the juice outside the normal range for that juice.

Secondly, more significant modifications that alter one or more basic characteristic of the juice but not to the extent that the juice would not still be acceptable if offered as a single juice product. The comment stated that such products would require a descriptive term as part of the product name to indicate the nature of the change but could still be identified as "juice."

Thirdly, products that have undergone major modifications that remove virtually all significant nutrients, resulting essentially in a sugar water product. The comment stated that while such products are acceptable as sweeteners, they should not be identified as juice or counted toward the juice content declaration.

The agency agrees that modified juices could be considered in three categories. It used a similar approach in the July 2, 1991, proposal (56 FR 30452 at 30460). The comment's first category is essentially the group of products that have undergone modifications so minor as to be within the normal range of properties of the original juice. These products do not require a modification of the name "———— juice," where the blank is filled with the name of the source fruit or vegetable.

The second category is illustrated in the July 2, 1991, proposal using "reduced acid frozen concentrated orange juice" and "acid-reduced pineapple juice" (56 FR 30452 at 30461). These products would require a name that describes the modification (§ 102.33(e)) but would not be prohibited under new § 101.30(k) from being included in the calculation of total juice percentage.

The third category described in the comment is clearly within the description in proposed § 102.33(e) (redesignated as new § 102.33(f)) and requires a name that fully describes the major modification. In suggesting that these products not be identified as "juice," the comment would prohibit the use of the word "juice" in the name of these modified juices. As discussed in the July 2, 1991, proposal and in response to comment 56 of this document, which follows, FDA disagrees and concludes that a name that fully describes the modifications made in the juice may include the word "juice" and its source.

56. A number of comments disagreed with the proposed provisions for naming juices that had undergone major modifications. They referred to these products as "stripped juices" and

"sugar water." They stated that the term "juice" should not be included in the name of such modified products. Some comments suggested alternative names such as "grape syrup," "apple syrup," or a similar term.

The agency proposed in § 102.33(d) (redesignated as new § 102.33(e)) that the common or usual name of a juice that has been modified shall include a description of the exact nature of the modification (e.g., "deflavored, decolored grape juice"). The agency believes that there is enough information in the description of the modification that consumers will be able to recognize the ingredient as different from the original juice.

Further, since juices with major modifications may not be included in the total percentage juice declaration, and the source fruit or vegetable from which the modified juice was derived may not be depicted on the label or other pictorial representation, consumers should not be misled by inclusion of the word "juice" in the name of juices in the ingredient list. Therefore, the agency is not granting the comments' request.

In addition, the suggestions for alternative names covered only some of the products in the category of juices that have undergone significant modifications. For example, other comments (comments 20 and 41 of this document) addressed juices from which the sugars had been removed. As discussed in response to those comments "reduced sugar ——— juice" may be an appropriately descriptive term for such a product with the name of the alternative sweetening ingredient appropriately declared.

Comments that addressed the issue. supported the provision in proposed § 102.33(e) (redesignated as new § 102.33(f)) that the fruit or vegetable source of a modified juice may not be depicted on the label by vignette or other pictorial representation.

Accordingly, FDA concludes that except for conforming the wording of § 102.33(f) to reflect the decision made with respect to modified juices in comment 39 of this document, the provision should be retained. The agency wishes to clarify that the provision addresses juice products that have undergone major modification and as a result are no longer recognizable at the time processing is complete, or whose nutrient profile has been diminished to a level below the normal nutrient range for the juice. The prohibition against depicting the fruit or vegetable on the label does not apply to juices that have been slightly modified but that still retain the basic properties of the original juice, e.g., acid-reduced grape juice.

IV. Other Issues

57. One comment stated that where a beverage is prepared from one or more juice concentrates this fact should be declared as part of the common or usual name.

The agency agrees. FDA's longstanding policy with regard to juice beverages made from concentrate is that a term such as "from concentrate" or "reconstituted" must be a part of the name of the juice, in letters not less than one-half the height of the letters in the name of the juice, e.g., lemon juice (§ 146.114) and orange juice from concentrate (§ 146.145). Accordingly, FDA has added as § 102.33(g) a requirement that when one or more of the juices in a juice beverage is made from concentrate, the name of the juice must include a term indicating that fact, such as "from concentrate," or "reconstituted." Such term may either be included in the name of each individual juice where appropriate, or it may be stated once adjacent to the product name so that it applies to all the juices (e.g., "cherry juice (from concentrate) in a blend of 2 other juices" or "cherry juice in a blend of 2 other juices (from concentrate)"). The term shall be in type size no less than one-half the height of the letters in the name of the fruit or vegetable juice. This type size requirement is consistent with similar provisions in existing regulations (e.g., §§ 146.114 and 146.145).

58. One comment pointed out that under § 101.22(i)(1)(iii) the presence of added natural flavors is not required to be declared in the name of the beverage unless the declared juices alone do not characterize the product before the addition of the added flavors. It requested that § 102.33(b) be amended to clarify this.

The agency agrees that the requested clarification may be helpful to readers of the regulation and is revising § 102.33(b) accordingly. Because the provision is already a part of FDA's food labeling regulations, this amendment is not substantive. It simply conforms § 102.33(b) to § 101.22(i)(1)(iii).

59. Comments supported the proposal to revoke the common or usual name regulations for noncarbonated beverage products that contain no fruit or vegetable juice (§ 102.30) and for diluted orange juice beverages (§ 102.32). They agreed with FDA's position that because these products would be covered under new § 101.30 and the revised § 102.33, the separate regulations are no longer needed. Accordingly, as proposed, FDA is revoking these two regulations.

V. Effective Date

FDA proposed to make the percent juice labeling regulations effective on the same date as the mandatory nutrition labeling final rule (i.e., May 8, 1993). However, the agency pointed out that the 1990 amendments state in section 10(c) of the 1990 amendments that percent juice labeling was to take effect 1 year after enactment. Thus, on November 8, 1991, the statutory provision for percent juice declaration was to go into effect.

In response to the July 2, 1991, proposal many comments from the food industry strongly urged FDA to reconsider the effective date for percent juice labeling regulations. The comments argued that a November 8, 1991, effective date would not allow the food industry enough time to develop the required labeling and would significantly increase costs because present inventory would have to be discarded. The comments strongly urged FDA to establish a uniform effective date for the requirement for percent juice declaration with section 403(q) of the act (mandatory nutrition labeling) and section 403(r) of the act (health and nutrient content claims), which were added to the act by the 1990 amendments. Although FDA agreed with these comments, it had no authority to provide the requested exemptions or extend the effective date.

A technical amendment (Pub. L. 102–108) was enacted on August 17, 1991, in which Congress amended the 1990 amendments to delay the effective date of the percent juice labeling requirements. Notice of this change in the effective date was given in the Federal Register of November 27, 1991 (56 FR 60877). Under this amendment the new percent juice labeling requirements for fruit and vegetable juice beverages apply to labels attached to these products after May 8, 1993.

60. Many comments responding to this proposal objected to the proposed effective date of November 8, 1991, for compliance with the requirements of the percentage juice declaration provisions because of the cost and time involved in making the necessary labeling changes. The agency also received a comment requesting a temporary exemption from the May 8, 1993, statutory effective date established by the technical amendment. The comment requested that the requirement for percentage juice declaration on the labels of beverages purporting to contain juice be implemented concurrently with any later applicability date that the agency

may prescribe for the nutrition labeling regulations pursuant to section 10(a)(3)(B) of the 1990 amendments. The comment suggested that the effective date for the percent juice declaration be delayed until May 8, 1994, on the basis of the proviso in section 403(i) of the act which states that: "* * * to the extent that compliance with the requirements of clause (2) of this paragraph is impracticable, or results in deception or unfair competition, exemptions shall be established by regulations promulgated by the Secretary." The comment cited case law and previous FDA policy as precedent for the requested temporary exemption.

The agency is not persuaded by the arguments and assertions presented in the request for a temporary exemption from the statutory compliance date of May 8, 1993, for the requirement of percentage juice declaration. The agency acknowledges that section 403(i) of the act provides authority for exemption, and some such exemptions have been temporary. However, in light of the specific date (May 8, 1993) established by the technical amendment, and the failure of Congress to include provisions for a delay of the application of this provision, in contrast to the provision that it made for such a delay for the nutrition labeling and nutrient content claims provisions in the 1990 amendments, and without any indication in the legislative history that Congress wished to delay any longer the implementation of percentage juice declaration on beverages purporting to contain juice, the agency finds that a temporary exemption based on section 403(i) of the act is not sustainable. Therefore, the agency is not granting a temporary exemption from compliance with the percent juice declaration requirements or extending the effective date until May 8, 1994. However, because the amendments to part 102 are not directly responsive to section 7 of the 1990 amendments, and in order to minimize costs, FDA is making the amendments to part 102 effective on May 8, 1994.

VI. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857 and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

VII. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in July 2, 1991, proposal, the agency determined that under 21 CFR 25.24(a)(11), that this action is of a type that does not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required. No new information or comments have been received that would effect the agency's previous determination.

List of Subjects

21 CFR Part 101

Food Labeling, Reporting and recordkeeping requirements.

21 CFR Part 102

Beverages, Food grades and standards, Food labeling, Frozen foods, Fruit juices, Oils and fats, Onions, Potatoes, Seafood.

Therefore under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR parts 101 and 102 are amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.30 is added to subpart B to read as follows:

§ 101.30 Percentage juice declaration for foods purporting to be beverages that contain fruit or vegetable juice.

(a) This section applies to any food that purports to be a beverage that contains any fruit or vegetable juice (i.e., the product's advertising, label, or labeling bears the name of, or variation on the name of, or makes any other direct or indirect representation with respect to, any fruit or vegetable juice), or the label or labeling bears any vignette (i.e., depiction of a fruit or vegetable) or other pictorial representation of any fruit or vegetable, or the product contains color and flavor that gives the beverage the appearance and taste of containing a fruit or vegetable juice. The beverage may be carbonated or noncarbonated, concentrated, full-strength, diluted, or contain no juice. For example, a soft drink (soda) that does not represent or suggest by its physical characteristics, name, labeling, ingredient statement, or advertising that it contains fruit or vegetable juice does not purport to contain juice and therefore does not require a percent juice declaration.

(b)(1) If the beverage contains fruit or vegetable juice, the percentage shall be declared by the words "Contains ———— percent (or %) ———— juice" or " ———— percent (or %) juice," or a similar phrase, with the first blank filled in with the percentage expressed as a whole number not greater than the actual percentage of the juice and the second blank (if used) filled in with the name of the particular fruit or vegetable (e.g., "Contains 50 percent apple juice" or "50 percent juice").

(2) If the beverage contains less than 1 percent juice, the total percentage juice shall be declared as "less than 1 percent juice" or "less than 1 percent ———— juice" with the blank filled in with the name of the particular fruit or vegetable.

(3) If the beverage contains 100 percent juice and also contains non-juice ingredients that do not result in a diminution of the juice soluble solids or, in the case of expressed juice, in a change in the volume, when the 100 percent juice declaration appears on a panel of the label that does not also bear the ingredient statement, it must be accompanied by the phrase "with added ————," the blank filled in with a term such as "ingredient(s)," "preservative," or "sweetener," as appropriate (e.g., "100% juice with added sweetener"), except that when the presence of the non-juice ingredient(s) is declared as a part of the statement of identity of the product, this phrase need not accompany the 100 percent juice declaration.

(c) If a beverage contains minor amounts of juice for flavoring and is labeled with a flavor description using terms such as "flavor", "flavored", or "flavoring" with a fruit or vegetable name and does not bear:

(1) The term "juice" on the label other than in the ingredient statement; or

(2) An explicit vignette depicting the fruit or vegetable from which the flavor derives, such as juice exuding from a fruit or vegetable; or

(3) Specific physical resemblance to a juice or distinctive juice characteristic such as pulp then total percentage juice declaration is not required.

(d) If the beverage does not meet the criteria for exemption from total juice percentage declaration as described in paragraph (c) of this section and contains no fruit or vegetable juice, but the labeling or color and flavor of the beverage represents, suggests, or implies that fruit or vegetable juice may be present (e.g., the product advertising or labeling bears the name, a variation of the name, or a pictorial representation of any fruit or vegetable, or the product contains color and flavor that give the beverage the appearance and taste of containing a fruit or vegetable juice), then the label shall declare "contains zero (0) percent (or %) juice". Alternatively, the label may declare "Containing (or contains) no ———— juice", or "no ———— juice", or "does not contain ———— juice", the blank to be filled in with the name of the fruits or vegetables represented, suggested, or implied, but if there is a general suggestion that the product contains fruit or vegetable juice, such as the presence of fruit pulp, the blank shall be filled in with the word "fruit" or "vegetable" as applicable (e.g., "contains no fruit juice", or "does not contain fruit juice").

(e) If the beverage is sold in a package with an information panel as defined in § 101.2, the declaration of amount of juice shall be prominently placed on the information panel in lines generally parallel to other required information, appearing:

(1) Near the top of the information panel, with no other printed label information appearing above the statement except the brand name, product name, logo, or universal product code; and

(2) In easily legible boldface print or type in distinct contrast to other printed or graphic matter, in a height not less than the largest type found on the information panel except that used for the brand name, product name, logo, or universal product code.

(f) The percentage juice declaration may also be placed on the principal display panel, provided that the declaration is consistent with that presented on the information panel.

(g) If the beverage is sold in a package that does not bear an information panel as defined in § 101.2, the percentage juice declaration shall be placed on the principal display panel, in type size not less than that required for the declaration of net quantity of contents statement in § 101.105(i), and be placed near the name of the food.

(h)(1) In enforcing these regulations, the Food and Drug Administration will calculate the labeled percentage of juice from concentrate found in a juice or juice beverage using the minimum Brix levels listed below where single-strength (100 percent) juice has at least the specified minimum Brix listed below:

Juice	100 percent juice[1]
Acerola	6.0
Apple	11.5
Apricot	11.7
Banana	22.0
Blackberry	10.0
Blueberry	10.0
Boysenberry	10.0
Cantaloupe Melon	9.6
Carambola	7.8
Carrot	8.0
Casaba Melon	7.5
Cashew (Caju)	12.0
Celery	3.1
Cherry, dark, sweet	20.0
Cherry, red, sour	14.0
Crabapple	15.4
Cranberry	7.5
Currant (Black)	11.0
Currant (Red)	10.5
Date	18.5
Dewberry	10.0
Elderberry	11.0
Fig	18.2
Gooseberry	8.3

Juice	100 percent juice[1]
Grape	16.0
Grapefruit	10.0
Guanabana (soursop)	16.0
Guava	7.7
Honeydew melon	9.6
Kiwi	15.4
Lemon	[2]4.5
Lime	[2]4.5
Loganberry	10.5
Mango	13.0
Nectarine	11.8
Orange	11.8
Papaya	11.5
Passion Fruit	14.0
Peach	10.5
Pear	12.0
Pineapple	12.8
Plum	14.3
Pomegranate	16.0
Prune	18.5
Quince	13.3
Raspberry (Black)	11.1
Raspberry (Red)	9.2
Rhubarb	5.7
Strawberry	8.0
Tangerine	11.8
Tomato	5.0
Watermelon	7.8
Youngberry	10.0

[1] Indicates Brix value unless other value specified.
[2] Indicates anhydrous citrus acid percent by weight.

(2) If there is no Brix level specified in paragraph (h)(1) of this section, the labeled percentage of that juice from concentrate in a juice or juice beverage will be calculated on the basis of the soluble solids content of the single-strength (unconcentrated) juice used to produce such concentrated juice.

(i) Juices directly expressed from a fruit or vegetable (i.e., not concentrated and reconstituted) shall be considered to be 100 percent juice and shall be declared as "100 percent juice."

(j) Calculations of the percentage of juice in a juice blend or a diluted juice product made directly from expressed juice (i.e., not from concentrate) shall be based on the percentage of the expressed juice in the product computed on a volume/volume basis.

(k) If the product is a beverage that contains a juice whose color, taste, or other organoleptic properties have been modified to the extent that the original juice is no longer recognizable at the time processing is complete, or if its nutrient profile has been diminished to a level below the normal nutrient range for the juice, then that juice to which such a major modification has been made shall not be included in the total percentage juice declaration.

(l) A beverage required to bear a percentage juice declaration on its label shall not bear any other percentage declaration that describes the juice content of the beverage in its label or in its labeling (e.g., "100 percent natural" or "100 percent pure!"). However, the label or labeling may bear percentage statements clearly unrelated to juice content (e.g., "provides 100 percent of U.S. RDA of vitamin C").

PART 102—COMMON OR USUAL NAME FOR NONSTANDARDIZED FOODS

3. The authority citation for 21 CFR part 102 continues to read as follows:

Authority: Secs. 201, 403, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 343, 371).

§ 102.30 [Removed]

4. Section 102.30 Noncarbonated beverage products containing no fruit or vegetable juice is removed from subpart B.

§ 102.32 [Removed]

5. Section 102.32 Diluted orange juice beverages is removed from subpart B.

6. Section 102.33 is revised to read as follows:

§ 102.33 Beverages that contain fruit or vegetable juice.

(a) For a carbonated or noncarbonated beverage that contains less than 100 percent and more than 0 percent fruit or vegetable juice, the common or usual name shall be a descriptive name that meets the requirements of § 102.5(a) and, if the common or usual name uses the word "juice," shall include a qualifying term such as "beverage," "cocktail," or "drink" appropriate to advise the consumer that the product is less than 100 percent juice (e.g., "diluted grape juice beverage" or "grape juice drink").

(b) If the product is a diluted multiple-juice beverage or blend of single-strength juices and names, other than in the ingredient statement, more than one juice, then the names of those juices, except in the ingredient statement, must be in descending order of predominance by volume unless the name specifically shows that the juice with the represented flavor is used as a flavor (e.g., raspberry-flavored apple and pear juice drink). In accordance with § 101.22(i)(1)(iii) of this chapter, the presence of added natural flavors is not required to be declared in the name of the beverage unless the declared juices alone do not characterize the product before the addition of the added flavors.

(c) If a multiple-juice beverage or blend of single-strength juices contains a juice that is named or implied on the label or labeling other than in the ingredient statement (represented juice), and also contains a juice other than the named or implied juice (nonrepresented juice), then the common or usual name for the product shall indicate that the represented juice is not the only juice present (e.g., "Apple blend; apple juice in a blend of two other fruit.")

(d) In a multiple-juice beverage or blend of single-strength juices where one or more, but not all, of the juices are named on the label other than in the ingredient statement, and where the named juice is not the predominant juice, the common or usual name for the product shall:

(1) Indicate that the named juice is present as a flavor or flavoring (e.g., "Raspcranberry"; raspberry and cranberry flavored juice drink); or

(2) Include the amount of the named juice, declared in a 5- percent range (e.g., Raspcranberry; raspberry and cranberry juice beverage, 10- to 15-percent cranberry juice and 3- to 8-percent raspberry juice). The 5-percent range, when used, shall be declared in the manner set forth in § 102.5(b)(2).

(e) The common or usual name of a juice that has been modified shall include a description of the exact nature of the modification (e.g., "acid-reduced cranberry juice," "deflavored, decolored grape juice").

(f) If the product is a beverage that contains a juice whose color, taste, or other organoleptic properties have been modified to the extent that the original juice is no longer recognizable at the time processing is complete, or if its nutrient profile has been diminished to a level below the normal nutrient range for the juice, then the source fruits or vegetables from which the modified juice was derived may not be depicted on the label by vignette or other pictorial representation.

(g) If one or more juices in a juice beverage is made from concentrate, the name of the juice must include a term indicating that fact, such as "from concentrate," or "reconstituted." Such terms must be included in the name of each individual juice or it may be stated once adjacent to the product name so that it applies to all the juices, (e.g., "cherry juice (from concentrate) in a blend of two other juices" or "cherry juice in a blend of 2 other juices (from concentrate)"). The term shall be in a type size no less than one-half the height of the letters in the name of the juice.

Dated: October 27, 1992.

Regulatory Impact Analysis of the Final Rules to Amend the Food Labeling Regulations

AGENCY: Food and Drug Administration, HHS.

ACTION: Regulatory impact analysis statement.

SUMMARY: The Food and Drug Administration (FDA) is publishing the final regulatory impact analysis (RIA) that it has prepared under Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354). This study presents the costs and benefits of the food labeling regulations that FDA is issuing. FDA is issuing these final rules (published elsewhere in this issue of the Federal Register) in response to the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) and as part of the Secretary of Health and Human Services' (the Secretary's) food labeling reform initiative. The agency has prepared this comprehensive RIA document for these regulations because, when taken together, they constitute a major rule.

FOR FURTHER INFORMATION CONTACT: Richard A. Williams, Jr., Center for Food Safety and Applied Nutrition (HFF–303), Food and Drug Administration,200 C St. SW., Washington, DC 20204, 202–205–5271.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of November 27, 1991 (56 FR 60366 et seq), FDA published a number of proposed food labeling regulations to implement the provisions of the 1990 amendments (Pub. L. 101–535). In the same issue of the Federal Register (56 FR 60856, November 27, 1991), FDA published an RIA (hereinafter referred to as the 1991 RIA proposal) which preliminarily estimated the costs and benefits of the various proposed regulations and on which FDA asked for comments. Interested persons were given until February 25, 1992, to comment. FDA received approximately 350 letters, each containing one or more comments, from health professionals, trade associations, Federal and State Governments, foreign governments, consumer advocacy organizations, consumers, professional societies, food manufacturers and distributors, and academia. Many of the issues addressed in the 1991 RIA proposal are covered in the separate final rules issued concurrently with this document.

Comments have not altered FDA's preliminary finding that the food labeling reform initiative, taken as a whole, will have associated costs in excess of the $100 million threshold that defines a major rule. Therefore, in accordance with Executive Order 12291, FDA has developed one comprehensive final RIA that presents the costs and benefits of all of the food labeling proposals taken together.

In addition, FDA is publishing elsewhere in this issue of the Federal Register a final rule to announce its decision to delay the application of the nutrition labeling and nutrient content claims provisions of the Federal Food, Drug, and Cosmetic Act (the act). In that rule FDA concluded that requiring compliance with section 403(q) or (r)(2) of the act (21 U.S.C. 343(q) or (r)) on May 8, 1993, would cause an "undue economic hardship" on the food industry in that there would be costs to the food industry that are excessive and more than Congress intended. All comments regarding the applicability date are addressed in that document.

FDA also published, as a component of the 1991 RIA proposal, a preliminary regulatory flexibility analysis which addressed the issue of small businesses. The 1990 amendments granted an exemption from mandatory nutrition labeling for small businesses. Under section 403(q)(5)(D) of the act, a small business is defined as a business with less than $500,000 annual gross sales or a business with annual gross sales of more than $500,000 but less than $50,000 in food sales. The exemption does not apply to those products that make nutritional claims or voluntarily provide nutrition information.

Comments concerning this exemption stated that this exemption was too low and are discussed more thoroughly in the mandatory nutrition labeling final rule published elsewhere in this issue of the Federal Register. FDA, in response to these comments, participated in a series of public forums that had been scheduled by the U.S. Department of Agriculture (USDA) to discuss the small business issue. In addition, FDA published a notice in the Federal Register asking for comments on this issue. As of publication of these rules and the final RIA, the exemption has not been changed. FDA will discuss in more detail the affect of the 1990 amendments on small businesses in a final Regulatory Flexibility Analysis published subsequent to these final rules.

II. Regulatory Options

Under the Regulatory Flexibility Act, FDA is required by law to consider ways to reduce the regulatory burden on small businesses. One conceivable regulatory option would be to allow product lines with fewer than 500,000 unit sales annually produced by small firms (firms with less than 500 employees) to make reasonable estimates of mean nutrient content rather than complying with the 80/100/120 rules.

Under the regulatory option currently selected, class I nutrients (added nutrients) including vitamins, minerals, protein, dietary fiber, and potassium are required to have at least 100 percent of the listed value within specified variances. Class II nutrients (naturally occurring), including vitamins, minerals, proteins, total carbohydrates, dietary fiber, other carbohydrates, polyunsaturated or monounsaturated fat, or potassium must have at least 80 percent of the value for the nutrient declared on the label within specified variances. Finally, a food with a label declaration of calories, sugars, total fat, saturated fat, cholesterol, or sodium is misbranded under section 403(a) of the act if the nutrient content of the composite sample is greater than 20 percent more than the declared amount, again within the variance specified for the appropriate test. In addition, in new § 101.9(g)(6), reasonable excesses over or under the labeled amounts are allowed where current good manufacturing practices (CGMP's) are used. This option would replace these values with a requirement to list the mean value within variances established for specific nutrient tests and allowing reasonable excesses over or under the labeled amounts where CGMP's are used. This option could either exist as a blanket exemption for small firms or one that is made by special request on a per firm basis to the agency.

Thus small firms could determine nutrient levels by analysis, by calculation using nutrient data bases of ingredients and recipes, or by other reasonable means that provide assurance that the value declared is the mean value of a particular nutrient in the food product. This option would reduce the burden on small business by allowing the use of means rather than values determined by analytical testing in the declaration of nutrient content.

Approximately 59 percent of all food products have fewer than 500,000 units sold annually and are produced by

small firms. This option would significantly reduce analytical costs by between $235 and $600 million depending upon the rate of retesting that would otherwise be done. In addition, this option will prevent small business failure which may occur for small firms with very low product volume. This option would result in virtually no loss in benefits because the occasional errors in labeling may offset one another. In addition, although this type of exemption would represent a large number of products, it represents only about 2 percent of the diet. Thus, for example, if these manufacturers were to approximate wrong (or intentionally misrepresent their products) concerning the amount of total fat in their product such that all of the products in this category underreported the amount of fat by 50 percent, and if all consumers were 100 percent mislead by such underreporting, it would only result in a 1 percent error in fat consumption. Given that such errors in reporting are: (1) Likely to balance out; (2) will probably be corrected by enforcement over time; and, (3) that it is unlikely that all consumers would be misled by gross errors, a significant loss of benefits as they have been calculated in this regulatory impact analysis seems unlikely.

An alternate standard for coverage of this option, such as exempting small firms (500 or less employees) with less than 100,000 units could also be chosen. This would exempt 51 percent of the products covered by the 1990 amendments, but it would exempt less than 2 percent of the diet.

Although FDA is allowing the "reasonable basis" standard in food service establishments making nutrient content claims and health claims, FDA believes that there is a significant difference between the criteria used to determine whether or not a claim is justified, and the criteria used to determine the quantified level of a nutrient to be reported on a food label. In addition, FDA believes that the option that it has chosen is also consistent with the other relevant sections of the act including sections 402(b) and 403(a) (21 U.S.C. 342(b) and 343(a)).

III. Costs of the Regulations

A. General

In the 1991 RIA proposal, FDA determined that about 17,000 domestic food manufacturers and 260,000 labels would be affected by the regulations promulgated in response to the 1990 amendments. Of these, approximately 160 dietary supplement manufacturers would alter approximately 3,400 unique dietary supplement products. In addition, 96,000 food service establishments would also be required to alter their menus if they are not in compliance with nutrient content and health claims regulations.

Categories of costs include administrative, analytical, printing, inventory disposal, and reformulation. In all cost categories, except administrative costs, the costs of relabeling products produced and labeled in foreign countries cannot be separated from those products produced and labeled domestically. Thus, the administrative costs considered are domestic costs only, whereas the printing, inventory, and analytical costs considered are multinational.

In the 1991 RIA proposal, mandatory ingredient labeling for standardized foods and certified colors were separated from the other actions because it was to take effect in November of 1991. Costs for these provisions, as proposed, were $128 million.

In the **Federal Register** of July 2, 1991 (56 FR 30452), FDA published a proposal on the declaration of percentage juice. FDA determined that the costs which would occur as a result of those proposed requirements would be $40 million, based on an effective date of November 8, 1991. When the 1991 RIA proposal was published, the proposed requirements regarding the declaration of percentage juice were to become effective concurrently with the requirements for mandatory nutrition labeling which would have resulted in lowering the incremental costs to $1 million. However, because those provisions are subject to being enforced 9 months before the agency will enforce the requirements for mandatory nutrition labeling, the costs are appropriately determined to be the original assessment of $40 million. FDA received no comments to the original proposal objecting to its determination of the costs. Therefore, the agency is not amending its original estimate of the costs of declaring percentage juice.

Voluntary nutrition labeling of raw fruit, vegetables, and fish is also separable from all other provisions of the 1990 amendments because it affects supermarkets, not food manufacturers. The agency estimated these costs to be between $117 to $155 million.

The costs to food manufacturers for all other labeling regulations, including percent juice labeling, mandatory nutrition labeling, nutrient content claims definition, health claim labeling, format changes, and others, were estimated in the 1991 RIA proposal to be as high as $1.3 billion, depending on the compliance period chosen.

In addition, FDA estimated that the costs to restaurants and other food service establishments to reprint menus not in conformance with nutrient content or health claim proposed regulations would be $116 million.

FDA estimated that total costs of the proposed rules to implement the 1990 amendments, excluding voluntary supermarket labeling, would be approximately $1.5 billion. The agency also determined that if the agency opted to allow an additional 6 months or an additional year to the compliance period provided for by the statute, total costs would decrease to $.8 billion and $.6 billion, respectively.

In October 1992, Congress passed the Dietary Supplement Act of 1992 (DS Act). This act prevents the agency from implementing the 1990 amendments as they apply to dietary supplements until December 1993. This act requires the agency to issue proposed regulations applicable to dietary supplements by June 15, 1993. Because this document is intended to determine the costs and benefits of all regulations implementing the 1990 amendments, the agency is responding to the comments regarding dietary supplements with tentative conclusions and is presenting preliminary estimates of those costs. The agency will address any alterations to these estimates when it issues regulations on the labeling of dietary supplements.

In response to its assessment of the costs in the 1991 RIA proposal, FDA also received several comments regarding costs from firms whose products are regulated by USDA, not FDA. The agency has forwarded these comments to USDA for consideration in their RIA.

1. One comment stated that FDA's cost analysis could not be correct because it is impossible to accurately estimate costs.

The agency disagrees with the comment. The agency recognizes that costs of regulation are complex and often difficult to measure with 100 percent accuracy. However, after studying the industries affected and considering the comments, FDA is confident that it has determined the costs of the regulations with reasonable accuracy. The agency will not amend its cost estimates based on this comment.

2. One comment stated that because it would take up to 30 years to see the benefits of the regulations, FDA should calculate the costs of nutrition labeling for 30 years. The comment criticized FDA for limiting the costs to a 5-year period.

FDA disagrees with this comment. FDA has determined that the benefits will occur sooner than 30 years. For calculation purposes, FDA assumed that the lag time for cancer is 10 years. Beyond 20 years, the discount rate drives the benefits too low to be significant. FDA, therefore, calculated benefits over 20 years for ease of computation. For the sake of consistency, FDA also calculated the costs over 20 years. FDA did not limit its determination of costs to 5 years as the comment mistakenly understood. FDA is calculating the final costs and benefits similarly.

B. Administrative Costs

In the 1991 RIA proposal, FDA determined that administrative costs would be approximately $177 million, of which $16 million are attributable to mandatory ingredient labeling of standardized foods and certified colors. FDA received one comment from an industry association that stated that FDA provided a fairly reasonable assessment of the administrative portion of total cost. This judgment was based on the association's evaluation of such costs for the firms it represents. However, FDA received several other comments criticizing its estimates.

3. Two comments stated that administrative costs are more closely related to the number of products or labels than to the number of firms. One firm stated that administrative costs will be high because of the number of units involved and the fact that the product is packaged at many different locations by third-party vendors. This situation, the comment stated, will necessitate additional administrative costs in the nature of man-hours for coordination.

FDA acknowledges that the comment may be correct but has no additional information to support this claim. In its original analysis, FDA assumed that administrative costs differed based on firm size. In part, this assumption is based not only on the bureaucratic difficulties inherent in larger companies, but also on the assumption that larger firms produce a greater number of products. The comment did not state nor supply data as to whether changing this assumption would increase or decrease administrative costs. Thus, FDA is not amending its final administrative cost estimates based on this comment.

4. Several comments stated the cost of increased errors should be included in administrative costs, especially for smaller firms. The comment stated that error rates will increase because of: (1) The unreasonably short timeframes in which all label changes will be made, (2) inexperienced short-term personnel hired to relieve the enormous strains on capacity, and (3) the novelty and magnitude of the changes themselves.

FDA agrees that firms may experience increased error rates which may increase administrative costs. FDA also agrees that these costs will be significantly reduced by allowing firms additional time to comply with labeling regulations. However, FDA is not amending its final cost estimates to account for increased errors because the final rule allows additional time, and the comments did not provide information regarding either the rate at which errors would be increased or the cost of such errors. Also, FDA believes that the cost of increased errors would not significantly increase total costs. Finally, by delaying the date that it will apply section 403(q) and (r)(2) of the act, the agency is relieving the time pressures that the comments said would contribute to the error rates.

5. Several comments provided estimates of administrative costs. FDA received only one estimate for small firms, $3,000 per firm. Estimates for medium to large firms range from approximately $6,500 to over $1 million per firm. One manufacturer of both FDA and USDA regulated products stated that additional man-hours and a part-time consultant would be required to implement the proposed label requirements at a total cost of $53,300. Some comments provided separate estimates for internal administrative costs and external administrative costs. Internal administrative costs include travel expenses, overtime expenses, and payroll expenses and benefit costs for added employees. External administrative costs include such items as legal fees, temporary help, and consultants.

FDA recognizes that the factors that determine administrative costs are very complicated. In the 1991 RIA proposal, FDA estimated that administrative costs for intricate regulations would be $9,000 for small/medium firms and $68,450 for large firms, assuming a compliance date of May 8, 1993. Administrative costs would be less with longer compliance periods. Final administrative estimates are based on a compliance period ending in May 1994. Administrative costs would be $3,375 for small/medium firms and $25,700 for large firms. The range of administrative cost estimates submitted in the comments was extremely broad. Also, there were no identifiable patterns to the estimates given. Therefore, FDA is not altering its original estimates. In the future, FDA would be interested in obtaining more detailed data concerning the nature and level of the marginal administrative costs of regulation.

6. One comment stated that the cost of reading, analyzing, and commenting on the proposals should be addressed. The comment stated that thousands of people are spending many hours reading, analyzing, discussing, and explaining FDA proposals and writing, typing, copying, collating, and sending comments.

FDA recognizes that many resources are spent in the process of reviewing and responding to proposals. Whether these costs should be attributed to the regulation or considered normal costs of doing business in a regulated industry is debatable. Nevertheless, FDA has no information to determine the amount and value of resources spent in reviewing regulations and is, therefore, not amending its estimates based on this comment.

7. One comment argued that FDA should consider the cost that the implementing regulations would have on the Government, e.g., extra FDA personnel, laboratory supplies, and tax increases to the American consumer.

FDA agrees with this comment. FDA estimates that approximately 85 Full-Time Equivalents (FTE's) have been utilized in the 2 years of development of the implementing regulations. In addition, FDA estimates that 135 FTE's will be used each year during the next 20 years in recurring activities related to the implementing regulations, e.g., enforcement and petition review. Each FTE is currently valued at $75,000. Therefore, FDA's labor costs are about $6.4 million for start-up and $127 million in recurring costs (discounted at 5 percent). In addition, FDA estimates that other costs to the Government to implement the 1990 amendments are approximately $4.4 million in start-up costs and an additional $2 million per year over the next 20 years, or $25 million (discounted at 5 percent). Therefore, total estimated costs to the Federal Government are $163 million. FDA notes, however, that these costs do not constitute increased cost to either consumers or industry in that they do not represent an increase in funding to the Federal Government. The development and enforcement of these regulations is funded primarily by replacing other Government programs.

8. One dietary supplement manufacturer stated that FDA should take into account the total cost of administrative time rather than incremental costs associated with the regulatory action being taken.

FDA disagrees with this comment. Executive Order 12291 requires that FDA calculate the cost of this regulatory

action. Therefore, only incremental costs—those costs associated with the additional administrative effort required to comply with the implementing regulations—are relevant. Accordingly, FDA rejects the comment on this point.

9. One dietary supplement manufacturer stated that FDA's estimate of administrative costs for supplement manufacturers was incorrect. The comment suggested that if one mid-level executive spends 1 week trying to read and understand these regulations, the cost would be in excess of the $850 per firm estimated by FDA.

FDA neither agrees nor disagrees with this comment. Although the assumptions FDA made regarding administrative costs for dietary supplements may have resulted in underestimates, comments did not provide FDA with information with which reasonable estimates could be made. FDA will continue to study the supplement industry and will alter its estimates, if necessary, when the regulations regarding dietary supplements are issued. FDA is not currently altering its original estimate based on this comment.

C. Analytical Costs

In the 1991 RIA proposal, FDA estimated analytical costs to be $195 million, of which $112 million are initial one-time costs. Although one firm stated that its cost estimates verify the numbers reported by FDA in its 1991 RIA proposal, several other comments argued FDA's estimates were too low.

10. Several comments questioned FDA's assumption that some products are already tested. These comments stated that the agency's assumption that 20 percent of products are already performing all newly required tests and would require no additional testing is arbitrary and not based on survey or other data. These firms argued that no products are currently undergoing all testing that would be necessary for compliance because the definitions for some nutrients or food components will significantly change.

FDA is persuaded by this argument. In its final estimate, the agency is assuming that all products will undergo at least some analytical testing and is adjusting the costs for analytical tests accordingly. FDA is assuming that the 40 percent of foods that currently provide nutrition information will require testing for only the newly required nutrients. The remaining 60 percent of foods are not currently undergoing testing for any nutrients. Therefore, the incremental costs for this 60 percent of foods will be the cost of performing all required tests. This change in assumptions also affects administrative costs because the regulation will be complex (requiring testing) for all firms, rather than for 80 percent of firms as originally assumed.

11. One comment requested that FDA make its laboratories available for testing at a small or no fee in order that firms may offset at least some of the cost of the regulations.

FDA does not have the resources to make its laboratories available to do testing, nor can FDA charge a fee to do testing. Therefore, FDA rejects this request. Although the choice may affect the company's expenses, whether testing is performed in-house, by independent laboratories, or by FDA laboratories, the societal costs of the regulation are the same.

12. Many comments stated that testing costs per product may increase because of the increased demand on laboratories. One firm estimated that analytical work on a priority basis will add about $2,000 per product. Similarly, many comments suggested that an increase in demand for printing services would create additional costs.

FDA agrees that the price of testing may increase in the short run because of increased demand. However, because firms will have 15 months to comply, not six months as assumed by the comments, any increase in costs will not be significant. FDA is not considering these costs in its final estimate.

13. One comment argued that FDA's estimate of the cost of analytical testing is wrong because it is based on the number of products, rather than the number of labels. The comment stated that it is not clear that a correlation exists between the number of labels needed to test and the number of products. For example, the comment stated that "manufacturing for private labels may require more testing of essentially the same product due to ingredient demands for retailers."

FDA believes that the comment did not understand FDA's definition of products and labels. FDA defined a product as an individual formulation regardless of size of container. Any change in ingredients constitutes a separate product formulation. When a private label manufacturer changes a product's ingredients in order to meet different demands of retailers, a different product is created, and additional testing is required. However, if the manufacturer merely changes the packaging for different retailers but does not change the product formulation, there is no new product, only a new label. FDA concludes after consideration of the contractor's (Research Triangle Institute (RTI)) report and comments to the 1991 RIA proposal, that for each distinct product formulation a separate analytical test must be performed. Tests for each individual label are unnecessary. Therefore, FDA is not modifying its estimate of analytical testing in response to this comment.

14. Many comments suggested that analytical costs as originally calculated are too low because the number of products on which they were based is too low.

FDA agrees that the estimate of the number of products contained in the 1991 RIA proposal was too low. FDA also agrees with comments that some firms use different formulations of the same product for different geographical areas because of varying ingredient demands. FDA's count of products and labels is based on Universal Product Code (UPC) codes that may not pick up these variations. Also, certain specialty items that are not sold through distribution channels using UPC codes would not be counted. Comments did not provide adequate information from which FDA can amend its original assessment of the number of products based on these considerations. However, FDA reviewed its source of the number of products (A. C. Nielsen) and found that its estimate was incorrect.

FDA originally used data collected in 1987 that was derived from grocery store warehouses. Because many products are not distributed through warehouses, FDA undercounted the number of products. A. C. Nielsen has since revised its method of data collection to account for this problem. Therefore, FDA now estimates that there are 196,000 products. The estimate of the number of labels, which was based on an up-to-date count of UPC codes, remains unchanged at 257,000. However, FDA recognizes that these estimates are still understated because Nielsen surveys 3,000 grocery stores and does not extrapolate to the remaining stores. FDA does not have any information with which such an extrapolation could be made. FDA also recognizes that these are still underestimates because: (1) Some firms use different formulations of the same product for different geographical areas due to varying ingredient demands; (2) FDA's count of products and labels is based on UPC codes which may not pick up these variations; and (3) certain specialty items which are not sold through distribution channels using UPC codes would not be counted. However, FDA does not have any better data, nor did the comments provide

better data. Therefore, the final estimates are based on these figures.

15. One comment argued that FDA's calculation of testing costs for those 32 percent of firms already performing the currently required tests was wrong. This comment argued that subtracting the $135 for tests not required was wrong because this is a sunk cost that was already being imposed by FDA. The comment did not object to the subtraction of $135 from the $354 cost required for analysis under the current regulations because this portion of the $354 will not be incurred by first-time testers.

FDA disagrees with the first point. FDA is not reimposing the costs for tests no longer required. The marginal cost is the cost of required tests ($376) less the cost of tests previously required by regulations but not required by these final rules ($135). FDA agrees with the second point made by the comment. The costs per test is not changed.

16. One comment argued that FDA's analytical cost estimates should have included employee time to prepare samples for testing, review laboratory reports, interpret the results, and determine resulting nutrition values that can be placed on labels. The comment stated an appropriate estimate would be 2–1/2 hours per product at an average salary and benefits figure of $85.

FDA agrees that the employee's time for preparing samples should be included as part of the analytical costs. However, the other activities cited by the comment are not analytical costs but administrative costs and are considered in that section of the document. Having concluded that the cost of preparing the sample should be added to its initial analysis, the agency, using the average hourly earnings calculated by the Department of Labor, has determined that an appropriate cost would be 1/2 hour per sample at an average salary and benefits figure of $19 per hour. These costs are included in the agency's final estimate.

17. One comment suggested that analytical costs should include the value of lost products and packages destroyed to run analyses, as well as the cost of freight to ship to the laboratory.

FDA agrees that for those products not undergoing any testing, the cited activities should be included in the analytical costs of complying with these regulations. Although FDA has no specific information on the amount of product and packaging that would be destroyed, or on the cost of that product, FDA can make crude estimates. These estimates suggest that such costs will be small relative to total costs. For example, if the cost of manufactured food products is approximately $2 per unit, and approximately 12 units per product are destroyed to conduct analytical testing, the total cost would be $4.7 million. Because these costs represent less than 1 percent of total costs, FDA is not attempting to accurately determine the cost of lost product and package and is not including these costs in its final estimates.

18. Several comments disagreed with FDA's assumptions regarding the frequency of retesting. One comment stated that partial, if not full, retesting will occur each time a product is reformulated. The comment noted that this occurs more frequently than every 5 years. Another comment stated that retesting would occur quarterly. A third comment was told by a laboratory that FDA would require testing 3 or 4 times a year. This latter comment recommended that FDA recommend laboratory analysis no more than once every 5 years or when the recipe changes.

FDA does not have a set number of times a product must be tested in a year, nor does FDA determine the frequency with which analytical information should be verified. The agency simply requires that the information on the label conforms to the regulations. Therefore, if a product is reformulated, the manufacturer should retest the product. The agency has no information regarding the average frequency of reformulation, nor was such information submitted by the comments. However, FDA is persuaded that many firms may retest their products more frequently than every 5 years. FDA, for its final estimates, calculated analytical costs based on a retesting frequency ranging from annual retesting to once every 5 years.

19. One comment stated that testing would almost always be duplicated and, in many cases, triplicated.

FDA believes that this comment confirms its assumption in the 1991 RIA proposal that initial tests will be performed three times to confirm the results. Thus, no change in the agency's original assumptions are necessary in response to this comment.

20. One comment suggested that analytical testing for new product introductions under the new proposals would be more expensive than otherwise.

FDA disagrees with this comment. Although initial testing costs to firms may go up because of queuing, FDA is not convinced that demand for testing will ultimately exceed the supply of testing services. However, FDA is including the incremental additional cost of testing new products in its final estimates of analytical testing costs which the agency did not do in the 1991 RIA proposal.

21. One comment suggested that the added cost of analysis would burden small companies because their work would be done by already overworked commercial laboratories which charge high fees for services, sometimes in excess of $900 for a full nutritional profile. Another comment agreed, arguing that the cost per product, estimated at $1,482, represents approximately 3 percent of the gross revenue per product for the average small/medium firm.

FDA agrees that because of the smaller volume under which small firms operate, the additional analytical testing could cause a burden on smaller firms. FDA believes that giving firms a longer time to comply with regulations, until May 8, 1994, will alleviate some but not all of this burden by reducing the impact of queuing costs. In addition, FDA believes that allowing firms the option of using nutritional data bases, instead of requiring analytical testing, will reduce the burden on small firms by providing a low-cost alternative to analytical testing.

22. One large firm stated that all costs incurred would be passed along to consumers almost immediately, not over a 20-year period. That comment explained that the cost of analytical work cannot be financed over a 20-year period.

FDA does not agree with this comment. The comment misinterpreted the agency's calculations. FDA did not state in the 1991 RIA proposal that costs would be financed over a 20-year period. FDA analyzed costs that will be incurred immediately. In addition, FDA also determined that firms would retest their products periodically, even without reformulating, to verify the accuracy of the nutrition information reported on the label and calculated the costs of this retesting over the next 20 years.

23. Several comments provided estimates of the costs of analytical testing. Estimates of analytical testing per product ranged from $500 to $2,000.

FDA, in the 1991 RIA proposal, calculated the analytical cost per product to be $723 for those products that have been tested and $1,785 for those products that have not been tested. Because these estimates are within the range reported by comments, FDA is using them in the final RIA.

24. One large firm stated that because testing for protein quality would be changed under FDA's proposed rules, the cost of this test should be included

with testing for cholesterol, fiber, fatty acids, and sugars. The comment also stated that under FDA's definitions, analysis for complex carbohydrate content would also be required.

FDA agrees with this comment that the cost of testing for protein quality would increase under FDA's rules. FDA has determined, based on information from existing independent testing laboratories' price lists, that a change in the definition of protein quality will add approximately $540 per product to the cost of analytical testing. Therefore, total costs would increase by approximately $159 million over the next 20 years assuming products would be retested every 5 years or $440 million assuming annual retesting (discounted at 5 percent). (FDA notes that these are maximum estimates. The agency is providing values in the final rule on mandatory nutrition labeling, published elsewhere in this issue of the **Federal Register**, that should significantly reduce the costs of calculating protein quality for many foods.) FDA is not, however, adding complex carbohydrates to the list of nutrients required to be listed in the nutrition label (see final rule on mandatory nutrition labeling published elsewhere in this issue of the **Federal Register**). Therefore, no analysis for this nutrient is necessary.

25. One comment stated that the changeover to new Reference Daily Intake (RDI) values will require that all data bases be completely reprogrammed to reflect the new values, and that therefore the cost of reprogramming all data bases should be included as a cost to the regulations.

FDA agrees with this comment. Because RDI's differ from Recommended Dietary Allowance's and Daily Reference Value's, on which the nutrition label is based, data bases would need some new programming if the agency were to switch to RDI's. The comment did not provide any data regarding the additional costs resulting from such changes. FDA is not aware of the number of such data bases but notes that it would take a large number coupled with significant reprogramming costs to affect this cost estimate. Therefore, FDA believes that such costs will be small relative to the total costs of the regulation. However, because the DS Act prevents FDA from adopting revised RDI's at this time, the costs associated with switching to new RDI values will not occur.

26. One large firm commented that for most nutritionally-modified products, and for the foods for which they substitute, it is necessary to conduct a complete nutritional analysis to determine nutritional equivalence. The comment estimated the cost of testing for complete nutritional equivalence for one product to be $2,300 for the first lot and $1,200 for the remaining two confirmatory lots. Also, the comment stated that the agency's proposals require testing for several micronutrients not previously included in nutritional equivalency testing, such as Vitamin K and molybdenum.

The point of the comment is unclear. If the comment is referring to tests conducted when using nutrient content claims, FDA disagrees that such costs have not been considered. The costs associated with the use of nutrient content claims are the costs of obtaining the information to insure that the claim meets the definitions provided by FDA. All firms will obtain that information when performing analyses for the nutrition panel. Therefore, there are no incremental costs for using nutrient content claims. If, however, the comment is referring to substitute products, that policy is not changing, and the comment has no relevance. Finally, because of the moratorium under the DS Act, FDA has not adopted RDI's for Vitamin K or molybdenum. Therefore, no testing for these nutrients is necessary at this time. For these reasons, FDA will not change its estimates based on this comment.

27. Manufacturers of dietary supplements objected to FDA's assumption that, because of the nature of the product, full analytical testing is already performed on supplements. Comments stated that because full analytical testing is not currently done on dietary supplements, all dietary supplement products will undergo full nutrient content analysis.

FDA is persuaded by the comment. In the 1991 RIA proposal, FDA conceded that this assumption was merely supposition and requested information from industry sources on this point. FDA will develop an appropriate estimate of cost of analytical testing for dietary supplements as part of the rulemaking that the agency will complete in accordance with the DS Act.

28. Several dietary supplement manufacturers also stated that FDA's estimate of analytical costs was understated because the number of products was understated.

The agency's original analysis was based on a count of the number of unique supplement products reported in use during a small survey of consumers. Because of the small number of consumers sampled, FDA agrees that this was not an accurate source to determine the number of dietary supplement products. In comments to the 1991 RIA proposal, one association reported 25,000 products and 75,000 labels in use in the supplement industry. The association was unclear as to how these numbers were calculated, and how "supplement" was defined in order to arrive at these numbers. The agency believes these estimates seem large. However, because no better information currently exists, FDA is using these figures in calculating costs to dietary supplement manufacturers. FDA will further study the supplement industry and make any necessary changes to its estimates when regulations are issued in accordance in the DS Act.

D. Printing Costs

In the 1991 RIA proposal, FDA preliminarily determined that firms would spend approximately $112 million on printing costs to comply with mandatory ingredient labeling of standardized foods and certified colors, and approximately $750 million to comply with all other provisions, except labeling of raw fruit, vegetables, and fish. FDA received several comments criticizing the agency's calculation of printing and redesign costs.

29. One comment was concerned that FDA assumed that changes will occur only to the principle display panel (PDP) and to the information panel.

FDA is aware that mandated changes are so significant that the entire label will be changed. FDA accounted for this fact in the 1991 RIA proposal. In the model supplied by the contractor and used by FDA, label redesign was denoted as a "complex" label change which was used for all labels.

30. Several comments stated that capital costs associated with label printing are underestimated. The comments stated that for many firms, new labeling devices will be needed. One comment, for example, stated that food manufacturers may have to install new packaging or labeling systems if existing labels are not large enough to accommodate the new information. Comments stated labeling equipment would cost approximately $65,000.

FDA agrees that some firms may require new labeling devices but does not have enough information to determine how many new devices will be needed. Whether firms will need to increase package or label size to accommodate the new information will depend largely on the format selected. FDA is allowing a reduced format for small packages and very small packages may be exempt from nutrition information. The decision to purchase new machinery will also depend on how lengthy health claims are. FDA

does not believe that health claims will cause many firms to increase package size because health claims are voluntary. If a firm must increase package size and order new packaging equipment to accommodate a claim, many firms will not make the claim. Although FDA does agree that capital costs may be significant, inadequate information regarding the number of devices needed prevents the agency from quantifying these costs.

31. Several comments stated that FDA should include the cost of the first labels ordered under the new requirements because these initial label orders replace those labels that will not be in compliance.

In determining the impact of regulations, FDA is only concerned with incremental costs only. The cost of initial label orders is incremental only in the sense that labels are ordered to replace existing labels that are no longer in compliance. FDA included these costs in its calculation of the cost of label inventory disposal because disposed label inventory is valued at its replacement cost. To include both initial label orders and inventory disposal costs would be double counting. Therefore, FDA rejects these comments on this point.

32. One comment claimed that, as the compliance date nears, additional costs will be incurred as firms find it necessary to request smaller, less efficient print runs.

FDA agrees with this comment. However, the agency does not have information with which it can estimate these costs nor does it believe they will significantly add to the costs. FDA believes that giving firms a longer time to comply with these regulations will alleviate this burden.

33. Several comments provided estimates of printing costs ranging from $500 to $5,500 per label.

FDA believes its calculation of printing costs fits within this range. FDA calculated the cost of redesigning 257,000 labels within a 6-month compliance period at $862 million, or an average of $3,400 per product. FDA is using these same estimates, adjusted for a longer compliance period, in the final RIA.

34. Manufacturers of dietary supplements objected to FDA's analysis of printing costs as described in the 1991 RIA proposal. One manufacturer estimated redesign costs for all of its products to be $363,250 but did not provide the agency with the number of products that would be covered under this estimate. Other firms estimated relabeling costs per product to be between $400 and $5,000.

FDA tentatively concludes that its assessment of the redesign cost per label for dietary supplements was underestimated. FDA assumed that labels on supplement products were more similar to drug labels than conventional food labels. However, the comments were successful in convincing the agency that supplement labels are more similar to conventional food labels and would incur a similar cost of printing and redesign. FDA will revise its estimates for redesign cost per label for dietary supplements as part of the rulemaking that FDA will complete in accordance with the DS Act.

E. Label Inventory Disposal Costs

35. Many comments stated that FDA's estimate of inventory disposal costs were too low. One very large firm estimated its own cost of inventory disposal to be in excess of $10 million. Another comment estimated disposal costs for the dairy industry to be approximately $125 million. This comment stated that if the dairy industry represents 15 percent of food sales, then FDA's estimate must be understated.

FDA does not believe that it is possible to extrapolate disposal costs from one firm or industry to the aggregate. Inventory disposal costs are subject to too many different variables to make such comparisons. For example, smaller firms are known to hold larger inventories than large firms. However, large firms hold smaller inventories for a greater number of labels. The cost of inventory disposal is the value of replacing inventories. Costs will be higher per label for products for which the package is the label than for products with stick-on labels. Also, costs will be higher for those labels that are produced using expensive printing processes. Therefore, although an industry or firm may represent a certain percentage of food sales, that industry or firm will not necessarily represent the same percentage of label inventory disposal costs. FDA does not believe it understated label inventory disposal costs except in the case of dietary supplements as described below. Therefore, FDA is not amending its final estimates based on this comment.

36. One comment from a food manufacturer disagreed with the assumption that industry label inventories would not exceed 6 months.

The comment misunderstood FDA's calculations. Although FDA did make such an assumption in regard to manufacturers of dietary supplements, FDA used data provided in a study conducted by RTI to calculate inventory disposal costs applicable to conventional food manufacturers. These data showed that most firms would require longer than 6 months to deplete label inventories. Therefore, FDA is not changing its final estimates based on this comment.

37. Dietary supplement manufacturers objected to the assumption that existing label stock could be used up within the proposed compliance period. An association of supplement manufacturers stated that "the on-going recession has meant that production levels have been cut, resulting in greater than normal stocks of labels." The association stated that the cost of discarding inventory would be over $25 million in order to implement the new requirements by May 1993, $15 million by November 1993, and $8 million by May 1994.

FDA tentatively concludes that its estimates of inventory disposal for dietary supplement manufacturers were incorrect. FDA, in the 1991 RIA proposal, made an ad hoc assumption regarding disposal of dietary supplement labels. Based on information supplied by comments, the cost of inventory disposal for dietary supplement manufacturers is valued at $11.5 million for a compliance period ending May 1994. However, because the DS Act imposed a moratorium on implementation of the 1990 amendments with respect to dietary supplements, FDA is not including these costs in the final RIA.

F. Reformulation

38. Several firms criticized FDA for not including the costs of evaluating and executing changes in marketing strategies, searching and testing new brand names, and reformulating products. One association for supplement manufacturers estimated reformulation costs at $20,000 per product but did not state how many products would be reformulated. Another comment stated that new product introductions, of which there were 12,000 in 1991, typically cost between $5 and $7 million.

In the 1991 RIA proposal, FDA acknowledged that reformulation would take place because of these regulations but stated that it could not determine the costs of reformulation because of a lack of adequate information. FDA agrees that because of the changes in the market that these regulations induce, some products will be reformulated. However, FDA is not estimating either the costs or the benefits of such reformulation. The comments did not provide the agency with enough information to calculate the marginal costs of reformulation caused by these

regulations. Although it is known that new product introductions have grown at an annual rate of 15 percent since 1986, FDA cannot predict how these regulations might affect that rate. However, it seems likely that these regulations will encourage firms to offer more nutritious foods to consumers. FDA also questions the cost of $5 to $7 million as an average cost of new product introductions. FDA notes that many small gourmet and confectionery products reformulate often during the year and may have annual sales much lower than these figures. FDA believes the costs and benefits of reformulation will be significant but is unable to estimate either based on the comments received.

G. Costs to Food Service Establishments

39. One comment stated that the cost of providing nutrition information in food service establishments would be prohibitive. The comment stated that for a typical establishment offering 80 items, the cost of analytical testing would be $136,000.

FDA agrees that providing nutrition information in food service establishments would be costly and prohibitive for many firms. The 1990 amendments exempt food service establishments from providing nutrition information. However, the 1990 amendments do not exempt food service establishments that use nutrient content claims or health claims from meeting FDA definitions for nutrient content claims or health claims. FDA is not amending its final cost estimates based on this comment because the agency is not requiring nutrition labeling in food service establishments.

40. FDA received several comments stating that the estimates of costs to the food service industry is understated for the following reasons: (1) The number of establishments affected is understated, (2) the number of menus and menu boards is understated, and (3) the cost per menu is underestimated. An association for the restaurant trade stated that approximately 262,000 commercial establishments and 36,000 institutions have approximately 406,384 printed menus. The association determined that, based on analysis of entries in its annual menu contest, 89 percent of all printed menus include at least one nutrient content or health claim. Thus, nearly 362,000 individual menus and 233,000 establishments in the commercial sector are potentially affected by the regulations. Further, the association determined that at least 18 percent of printed menus would require revision of an entire section or symbol program. According to the association, the cost of changing printed menus requiring changes in terminology or individual menu items would be $500 per menu or $144 million. The cost of changing printed menus requiring changes to alter or replace sections or symbols would be $5,000 per menu, including the cost of analysis or data base use, or $366 million. Therefore, the costs to food service establishments would be $510 million. These cost estimates did not include costs associated with development of new menu items, costs of compliance for 178,355 commercial establishments likely to use menu boards, and costs of compliance for institutional establishments.

FDA has reviewed the calculations, data, and assumptions and is persuaded by the comments that certain costs to the food service industry as described in the 1991 RIA proposal were not accurately estimated. However, FDA notes that the association's estimates are overstated because of three issues: (1) The agency is requiring that food service establishments have only a reasonable basis to support nutrient content or health claims—no analyses or data bases are necessary; (2) the agency is deferring enforcement for small food service firms (10 or less individual establishments) for an additional year to facilitate compliance by this segment of the industry; and (3) the agency does not intend to include menus within its regulatory coverage.

The association estimated that analyses will cost between $700 and $950 for each of 4 recipes for 73,149 menus, or a total of $241 million. Total costs to food service establishments should be reduced by this amount. In the 1991 RIA proposal, FDA assumed that 30 percent of the establishments would normally change their food items during the proposed 6-month compliance period. FDA received no comments refuting this assumption. Extrapolating this assumption to account for the 9-month extension of the date of application of section 403(q) and (r)(2) of the act, indicates that 75 percent of all food offerings would normally be revised during the compliance period. For ease of calculation, the agency assumes that food service establishments make nutrient content claims only, not health claims for which the date of applicability has not been extended. In addition, the agency has determined that enforcement will be deferred on 75 percent of food service establishments. Therefore, the costs of compliance for food service establishments, adjusting for normal revisions and analytical testing, are $17 million. This cost is assumed to be an upper bound estimate as many claims made by restaurants may be consistent with the new definitions.

H. Other Costs

41. One comment stated that FDA overlooked the cost of advertising changes and related marketing expenditures that will be necessitated by these regulations. The comment stated that because most advertising in the visual media includes a picture of the product, the advertising will become obsolete because the label on the product will change. Also, marketing material such as recipe booklets, materials provided to the trade, and shelf tags will require revision or destruction.

FDA acknowledges that some firms may incur costs of changing advertising and marketing campaigns because of changes to the label required by these regulations. For example, in any instance in which a photograph of the product is shown in an advertisement, that advertisement will be made misleading if the label changes but the advertisement does not. Although advertising comes under the jurisdiction of the Federal Trade Commission, such changes will occur as an indirect result of FDA's regulatory actions, and the costs are attributable to these regulations. According to "Food Retailing Review" (The Food Institute, 1992 ed.) advertising budgets for food at home in 1991 were approximately $12 billion, or 4 percent of the total cost. It is unclear how much, if at all, advertising expenditures will increase because of these regulations. Also, it is likely that, within the 15 months firms have to comply with the mandatory nutrition labeling and nutrient content claims regulations, many of those advertisements would have been changed for other reasons. Therefore, FDA believes that the marginal costs of changing advertising because of these labeling regulations will not add significantly to total costs. Therefore, FDA is not amending its final estimates based on this comment.

42. One comment stated that FDA should include the costs of consumer education campaigns.

FDA agrees with this comment. Although not a direct component of these regulations, consumer education campaigns are an essential element of the 1990 amendments. In 1991, FDA and USDA initiated a multiyear food labeling education campaign to increase consumers' knowledge and effective use of the new food label and to assist consumers in making accurate and sound dietary choices. FDA and USDA themselves do not have adequate

resources to inform and educate the public effectively about the new food label and how to use it to plan a healthy diet. The agencies are working with other public and private sector organizations. FDA interprets its role as one of providing leadership in developing, and encouraging others to develop, programs that enable diverse audiences to use food labels effectively. The agency estimates that its efforts in this role may cost as much as $3 million in the next 5 years and in excess of 50 person-years. The agency, due to inadequate information, is not able to predict the costs to other Government agencies nor the multiplier effect on consumer groups, educators, mass media, the food industry, and other public and private sector organizations.

43. One comment concluded that much of the costs will be passed on to consumers, not borne by industry.

FDA does not have sufficient demand and supply information to estimate the amount of cost shifting that may occur as a result of the labeling costs. However, FDA has always considered costs to society without regard to who bears those costs. Therefore, FDA does not believe that it is important for the purposes of societal cost and benefit estimation to estimate the amount of cost shifting. However, for the purposes of estimating whether there is an "undue economic hardship" to industry, FDA does believe that this question is relevant, and this question has been addressed in the final rule published elsewhere in this issue of the Federal Register on the date of applicability of section 403(q) and (r)(2) of the act.

I. Summary of Costs

After examining the comments, FDA has recalculated the costs of the final rules. These final estimates are based on a 15-month compliance period ending in May 1994. Although some provisions of the 1990 amendments, i.e., health claims, will become effective on May 8, 1993, FDA received no comments regarding the separate costs of those provisions. Further, in the 1991 RIA proposal, FDA preliminarily determined that the costs of the labeling of ingredients in standardized foods and certified colors were $16 million for administrative costs and $112 million for printing. The costs of percent juice labeling have been estimated at $40 million. Comments did not result in a recalculation of these costs.

The comments mentioned many costs that FDA agrees could be included in the costs of food labeling regulations but cannot calculate because of a lack of information. These costs include the cost of increased errors, the resources spent in reviewing and commenting on proposed regulations, the cost of lost products and packages destroyed to run analyses, the capital costs associated with label printing, the costs associated with smaller, less efficient print runs, and the costs of reformulation. FDA believes that, with the exception of reformulation, these costs represent a small portion of the total costs and that not including them in the final estimates does not significantly alter FDA's conclusions.

Based on the information provided by the comments and the contractor's cost study, FDA now finds that administrative costs are $9,000 for small/medium firms and $68,450 for large firms when the compliance period is 6 months. Because FDA is extending the compliance to 15 months, costs will be $3,375 for small/medium firms and $25,700 for large firms, or $56 million for the 8,900 medium and large firms affected. Similarly, administrative costs to manufacturers of dietary supplements are $850 per firm with a 6-month compliance period. Adjusted to a 15-month compliance period, administrative costs to dietary supplement manufacturers are $320 per firm or $52,000. However, these costs may be greatly reduced depending upon the outcome of the proposals to be issued at a later date, as discussed above, in response to the DS Act. Thus, the costs to dietary supplement manufacturers are not being included at this time.

FDA has agreed with the comments that the costs to the Federal Government for implementing the 1990 amendments should be considered in its final estimates. As previously described in comment 7 of this document, FDA estimates that implementing the 1990 amendments will cost the Federal Government approximately $163 million in labor and capital over the next 20 years (5 percent discount rate). These costs will most likely not be incurred by increasing taxes on either consumers or industry as the food labeling information program will be funded by substituting efforts away from other Government programs. FDA did not attempt to estimate the costs to other governmental units or State governments.

FDA has determined that all products produced by medium and large firms will undergo some analytical testing. Approximately 40 percent of products will require full nutrient testing at a cost of $1,785 per product. The remaining 60 percent of products will require only partial testing because they have already been tested for some nutrients. The cost for testing these products is $723 per product. FDA is assuming a range of retesting from once every year to every 5 years on average. Analytical costs for mandatory nutrition labeling are $228 million in the first year. Total discounted analytical costs range from $466 million assuming retesting every 5 years and $1.1 billion assuming annual retesting (5 percent discount rate). The cost of collecting samples is between $17.9 and 22.8 million over the next 20 years (discounted at 5 percent) In addition, FDA estimates the cost of protein quality testing will be $540 per product or $185 million over the next 20 years assuming retesting every 5 years or $440 million assuming annual retesting.

The assumptions used to calculate printing costs for conventional foods remain unchanged by the comments. The cost of printing 257,000 food labels is estimated at $518 million for a compliance period ending in February 1994.

Review of the comments did not lead to any changes in the assumptions used to calculate inventory disposal costs except that FDA no longer assumes dietary supplement manufacturers will have enough time to dispose of all labels. Total costs for inventory disposal of conventional food labels is $6 million for a May 8, 1994, compliance date.

FDA has reviewed the calculations provided by food service establishments and has adjusted those calculations to account for a longer compliance period and normal menu revision. FDA is allowing food service firms the option of using a reasonable basis rather than analytical testing to support claims, further reducing costs. In addition, FDA is deferring enforcement for restaurants with 10 or less individual establishments. The cost to food service establishments, reflecting all adjustments, is $17 million.

The total costs of food labeling regulations range from $1.4 billion to $2.3 billion (discounted at five percent), depending on the frequency of reanalyzing products, excluding the cost of labeling raw fruit, vegetables, and fish, and assuming a 15-month compliance period ending in May 1994. In addition, costs of Government activities are estimated at $163 million.

IV. Benefit Estimation

As part of the 1991 RIA proposal, FDA published a labeling benefits model that examined the health benefits from consumer response to food labeling. In this model, FDA used economic theory to quantify the value of the reduction in coronary heart disease (CHD) and three types of cancer that

would result from modified diets in response to nutrition labeling. FDA received approximately 20 comments directly related to the benefits of nutrition labeling. Many comments addressed the benefits of specific rules. The agency is responding to these comments in the relevant individual final rules.

A. Benefits—General

44. Several comments questioned the credibility of the health benefit estimate, particularly as to whether risk reduction through change of dietary habits can be quantified.

FDA does not agree with this comment although FDA stresses that it views the benefit estimation of the 1990 amendments as a preliminary investigation into quantification of mandatory information disclosure. In addition, FDA notes that the agency is required by Executive Order 12291 to quantify benefits where possible and to use such estimates to select regulatory policy options that generate the largest net benefits. Therefore, FDA is not changing its estimate of the benefits based on this comment. FDA will continue to refine the methodology employed here as well as to seek alternative methodologies to measure these effects.

45. One comment noted that there will be reductions in health care and insurance costs that will result in cost savings to all consumers, whether disease afflicted or not.

FDA notes that health care estimates were included in the 1991 RIA proposal. FDA agrees that as demand for health care resources decreases, there will be price decreases that will affect all consumers and consequent reductions in insurance costs. However, benefit estimates are societal benefits which are real resource savings to all members of society, without regard to incidence. For example, estimates of the willingness-to-pay to reduce risk of illness and death reflect total societal values. Therefore, the benefits estimated in the 1991 RIA proposal reflect savings to all of society, whether disease afflicted or not, but this fact does not alter the quantitative total societal benefits and does not affect the final estimate of the benefits.

46. Another comment noted that there may be significant benefits from reduction in allergic responses to food.

The agency believes that the most significant additional ingredient information resulting from the 1990 amendments is the listing of ingredients in standardized foods. The agency believes, however, that the labeling of almost all standardized foods already contained this information before the passage of the 1990 amendments. Although the agency agrees that the required labeling of allergens such as hydrolyzed corn protein will have some benefits for preventing allergic responses, these benefits are expected to be small relative to the nutritional benefits of the final rules.

47. One comment suggested that because the agency accounted for the costs of product reformulations, it should estimate the benefits of reformulation.

Although FDA agrees that product reformulation will occur as a result of the 1990 amendments, FDA did not estimate either costs or benefits of product reformulation (see comment 38 of this document). The assumption underlying the benefit estimate is that firms did not reformulate foods just to participate in the shelf flag study (the FDA/Giant Special Dietary Alert (SDA) study cited in the 1991 RIA proposal) because the relative size of the market used in the study is small, and the time span was relatively short (1 year). The agency noted in the 1991 RIA proposal how difficult it would be to estimate the amount of reformulation that would take place.

48. Some comments addressed the purpose of the food label with respect to the projected benefits of the new labeling. One comment stated that the purpose of the food label is to inform consumers (presumably about nutritional values), while another stated that the purpose of the food label is to sell a product.

Compliance with the final regulations that respond to the 1990 amendments as well as with other regulations governing food labels will make the label, both the PDP and the information panel, more informative for consumers. Thus, estimated benefits derived from compliance with the 1990 amendments are not benefits to manufacturers from selling food but rather are benefits to consumers because manufacturers must comply with the law.

49. Another comment expressed concern that diet deficiencies might be a possible response to the new labeling information. This comment noted that some consumers may have negative benefits because they use food labels to modify their diet in a detrimental way. According to the comment, this result would occur because food nutrients are grouped in foods such that, for example, a product substitution may decrease fat intake slightly but result in a large increase in sodium intake.

As mentioned in the 1991 RIA proposal, FDA was aware of the possibility that these effects may occur and represent a potential bias towards overestimating benefits. However, FDA believes that it is unlikely that the provision of more information on food labels will lead to such effects. It is difficult to construe the labeling changes that respond to the 1990 amendments as being the cause of many ill-considered food choices. The disqualifying disclosure levels are intended to prevent such effects from occurring. Further, FDA believes that the consumer information campaigns now underway in response to the 1990 amendments will serve to further mitigate the chances of any such effect.

50. One comment stated that the only benefits that would arise from requiring restaurants to carry nutritional information would be for the chemical laboratories that do the testing.

The agency advises that it is not requiring full nutrition labeling for restaurants in these final rules. However, restaurants will be required to ensure that their judgments that a food has an appropriate level of a nutrient to qualify for a health claim or a nutrient content claim have a reasonable basis. There is no requirement for laboratory testing of such foods. Moreover, FDA does not agree that no other parties will benefit from these rules with respect to restaurants. Consumers will now have consistent, reasonably based signals from restaurant menus with regard to health claims and nutrient content claims that they can use to control their diets.

B. Consumer Response to Labeling

51. One comment contended that FDA's estimate of the consumer response to labeling was low. The comment argued that FDA's estimate of the percentage of consumers that read and understand labels, 45 percent, should be used as a measure of consumer behavior change in response to new labeling.

The agency rejects this view. The agency's estimate was based on actual consumer behavior measured in response to new labeling information (the FDA/Giant SDA study). As for the estimate of consumers who read and understand labeling, the agency notes that the cost of changing dietary behavior is greater than the cost of simply reading and understanding labels. The cost of changing dietary behavior includes search costs, costs of giving up some elements of taste, and possibly paying higher prices for the more nutritious foods. For this reason, it is likely that only a small percentage of consumers actually change their purchases in any meaningful way. In addition, FDA acknowledged factors

that would cause the benefit projections to be overestimated. For example, as noted in the 1991 RIA proposal, FDA does not have evidence that changes made in the FDA/Giant SDA program were lasting. Although FDA expects that consumers' diet/health link awareness will increase over time, it is not clear how much of an effect this increased awareness will have.

52. Other comments questioned whether consumers will use labels to actually change purchase behavior.

FDA believes that the SDA study supports its view that some consumers, although a small percent, will use labels to change their purchase behavior. In this study, shelf flags were used to alert consumers to the presence of desirable nutrient attributes. Netting out price changes, there were measurable shifts to more nutritious foods. Moreover, the SDA categories covered less than one-fourth of all of the food categories, and FDA believes it is likely that there will be responses in other categories of food because of the addition of other nutrients of concern as part of the 1990 amendments.

53. One comment to the RIA stated that the shelf flag highlighting in the SDA study overestimates benefits of the 1991 initiative because they do not apply to information required on the food label. The comment noted that, since shelf flag highlighting may have been used in addition to highlighting the product characteristics on the label, similar results will not be obtained unless retailers use shelf flags. The comment went on to say that it is unlikely that retailers will use shelf flags given disclosure requirements, type-size and placement requirements, and density-based requirements.

The agency notes that these final rules do not prohibit shelf flags from being used by manufacturers exactly as they were used by Giant Foods during the SDA study. The agency is announcing in the final rule on nutrient content claims, published elsewhere in this issue of the Federal Register, that it is encouraging retailers to use such devices consistent with the nutrient content claim definitions provided in that final rule. Thus, the agency believes that similar results will occur as a result of the 1990 amendments and is not changing its estimate based on this comment.

54. One comment expressed the view that the shelf flags in the SDA study are best related to regulations allowing health claims and nutrient content claims on labels, and that benefit estimates should be related to those provisions of the 1990 amendments.

FDA believes that all implementing regulations of the 1990 amendments will have benefits, although the bulk of such benefits may come with changes to the PDP where nutrient content claims and some health claims will be displayed. However, FDA is unable to separate the effects of the various aspects of the 1990 amendments on the basis of this comment or any other of the comments received. Therefore, FDA is not changing the benefits estimate based on this comment.

55. Another comment on the SDA study noted that FDA did not separate the effects of the shelf flags from other marketplace events such as price changes, advertising campaigns, price reductions, or couponing.

The agency notes that price changes were accounted for in the SDA study, although the other events mentioned represent a possible bias in the study. To the extent that such effects caused consumer purchase changes independent of the shelf flags, the agency agrees that such changes would result in the benefit estimate being an overestimate. However, no information was presented that would allow the agency to calculate the extent of this bias. The agency points out that this is one of several biases in the analysis that were noted in the 1991 RIA proposal.

56. One comment suggested that FDA examine microdata from SDA to determine whether Giant stores had a disproportionate number of people at risk for developing chronic diet-related diseases. They pointed out that if so, it would bias the outcome when the study is extrapolated to the entire U.S. population. Other comments noted that the Washington D.C. metropolitan area may not be representative based on demographic data.

The agency acknowledges these limitations of the data presented in the SDA study and recognizes that the benefit estimates provided in both the preliminary and the final RIA are soft because of the many assumptions made and the tenuous support for many of these assumptions. The agency believes, however, that it has made a novel first attempt at estimating the effects of this type of mandatory label information. A number of comments addressed the viability of the agency's assumptions in estimating these benefits but offered no data upon which to fashion better assumptions. The agency agrees that the Washington D.C. area may not be representative of the U.S. population as a whole but does not have any way to make the study representative. Thus, FDA is very aware of the imprecision of these benefit estimates. From these comments FDA has received no information that would alter its assessment of the expected change in dietary behavior from that reported in the 1991 RIA proposal.

C. Health Response to Improved Diet

57. One comment noted that FDA's estimate of the maximum preventable cases of cancer and CHD prevention from dietary changes was low relative to what was predicted by "significant scientific agreement." The comment used Table 13 in FDA's 1991 RIA proposal (56 FR 60856 at 60871, November 27, 1991), and estimated that, of the total cases estimated to be avoided, cancer cases represent 89.7 percent, and CHD the remaining 10.3 percent. Eliminating the years where 0 cases are expected to be prevented, the first 10 years for cancer and 2 years for CHD, the above percentages were applied to the total cases, 503,448 (Table 16, 56 FR 60856 at 60872). From these calculations, the comment noted that FDA's figures appear to show only 45,310 cancer cases and 2,797 heart disease cases are preventable through dietary intervention per year. These numbers were compared by the comment with other published numbers. For total preventable cancers, the comment updated a 1991 published estimate of 1,100,000 cases (per year in the United States) with an annual growth rate of 0.9 percent to obtain an average over the 10th to 20th years from the 1990 amendments of 1,258,230. The comment noted that FDA's estimate of preventable cancers (45,310) was only 3.6 percent of this figure, less than the 5 percent to 35 percent of cases preventable through diet. Another comment noted that the 2,797 estimated cases of CHD that would be prevented represent only 0.9 percent of the total cases, which it said was extremely low.

The agency disagrees that its figures are low. First, the agency's estimates were based on the difference between current dietary intakes and DRV's. DRV's are the U.S. Government recommendations for an achievable diet, not a maximal diet. A maximal diet would be much lower in fat content, for example, as well as containing other nutrient values much "stricter" than the RDI diet. The RDI diet might be construed to be "perfect," however, in the sense that it does not involve giving up all desirable foods to meet a reasonable health goal.

In addition, FDA notes that although there is significant scientific agreement that reductions in fat intake will reduce the risk of some cancers, the precise quantitative relationship has not been firmly established. It is unlikely, however, that the relationship between

fat intake and cancer will prove to be false.

Finally, it should be noted that FDA's figures from Table 16 in the 1991 RIA proposal (56 FR 60856 at 60872) are from reducing fat intake for FDA foods only, which does not include meat and poultry (regulated by USDA). Reductions of fat from consuming those foods will save additional lives and cases. Thus, FDA disagrees that its estimates are low and has not changed the benefit estimate of the 1990 amendments based on this comment.

58. One comment requested that FDA explain an apparent discrepancy. The comment took the number of total cases of illness estimated to be avoided for each scenario and divided them by the total number of deaths estimated to be avoided. The comment stated that the discrepancy arose because the total number of cases (cancer and CHD) avoided in the maximal FDA diet, approximately 42 percent resulted in lives saved, whereas in the scenario that applies to the benefit estimate, only 32 percent of cases avoided will result in lives saved.

The agency does not believe that this difference is a discrepancy. The explanation is that both total cases avoided and total lives saved are based on cancer and CHD. In the Browner model, which was used as a component of the FDA labeling benefits model, reducing fat intake changes the ratio of saturated fat to cholesterol intake. In the maximum health benefits scenario, this ratio is 2. As the amount of fat intake is reduced in response to labeling, this ratio declines to 1.3. The ratio of saturated fat to cholesterol changes are based on actual intake changes measured in the SDA study. In turn, as the ratio of saturated fat to dietary cholesterol decreases, the rate of CHD cases avoided (based on saturated fat) will decline relative to that of cancer cases avoided (based on total fat).

In the Browner model, it is assumed that all CHD cases result in death, but that only 45 percent of the cancer cases result in death. Thus, as there is no discrepancy, FDA concludes that no changes in the agency's benefit estimate are necessary in response to this comment.

59. One comment argued that it makes no sense to postulate that a perfect diet would only prevent 3.6 percent of cancer cases, but 42 percent of cancer deaths. Similarly, the comment stated that it is unlikely that there would be only a 0.9 percent reduction in incidence of heart disease but 4.5 percent reduction in deaths.

The agency disagrees with this comment. The comment is referring to the agency's estimate of the number of preventable cases of cancer and cases of death that would result from adoption of a perfect diet by all consumers (Table 15, 56 FR 60872). The comment appears to have incorrectly calculated the percentage of cancer deaths that will be avoided as a result of a perfect diet relative to the total number of cancer deaths in the United States. Rather than 42 percent as calculated by the comment, the agency calculates that 3.5 percent of all cancer deaths in the United States would be avoided if consumers adopt a perfect diet. This number, 3.5 percent, is calculated as follows: On average, it is expected, based on FDA calculations (56 FR 60872), that there would be approximately 18,985 cancer deaths avoided per year (following the 10-year lag from the beginning of a perfect diet). This number is obtained by multiplying the total number of deaths avoided (212,596) by 89.3 percent (the proportion of cancer deaths avoided) and dividing by 10, the number of years for which the model estimates cancer deaths being avoided. Therefore, if there are 545,718 total cancer deaths per year, then 18,985 deaths per year (3.5 percent) can be avoided as a result of adoption of a perfect diet. A similar calculation determines that CHD deaths avoided as a percent of CHD deaths per year (500,000) is about 0.3 percent.

60. Another comment states that the "total impact of the approved health claim on lipids and cancer will be a reduction of 0.28 percent of all cancer cases and an estimated prevention of 1,188 cancer deaths per annum, a total decline of 0.23 percent."

The agency's estimate of the benefits of the 1990 amendments apply to the whole of the 1990 amendments. Changes in dietary behavior, such as lipid reduction, are likely to be made by consumers in response to changes in the information panel including new nutrient and ingredient information, as well as to PDP changes such as new definitions for nutrient content claims and health claims. The agency is unable to separate out, based on this or any other comment received, the marginal change in consumer behavior solely in response to health claims and the resulting health effect. Thus, no change to the agency's benefit analysis has been made in response to this comment.

61. One comment noted that FDA has estimated a reduction in the consumption of fats by men and women to be 1.4 and 1.1 percent which translates to 1.49 and 0.67 grams, respectively. The comment went on to say that given that a "less" fat item will have a minimum of 3 grams less fat than a comparable choice, FDA's estimate would amount to only one improved serving choice every other day for an average male and every 4.5 days for an average female. The comment contended that this appears to underestimate the potential impact. The comment also noted that:

> The apparent use of a typical consumer, rather than of a bell distribution, would dramatically skew the impacts of the reduction on health * * * as minor reductions (1.1 to 1.4 percent) * * * cannot be expected to have a significant impact on risk reduction. Because actual reduction would be distributed across a curve, those whose reduction in cholesterol would be significant would experience a significant reduction in risk unrevealed by the FDA single, typical consumer model.

The agency did not use a typical consumer to estimate the benefits of the proposed regulations. In the Browner model, all age groups were used in 5-year increments (e.g., 40-to 45-year-olds) which would approximate the full distribution of age groups, not collapse all age groups into a typical consumer. This data (the actual distribution of intakes) came from the Continuing Survey of Food Intakes by Individuals. Furthermore, the agency is not persuaded by the argument concerning food choices. FDA agrees with the comment that rather than all consumers making small changes, what is more likely is that a small subset of consumers will make dietary changes, or that some consumers will only change a small portion of their diets. This pattern of response would explain the relatively modest changes that occurred in the SDA study. FDA notes that consumer response to new information has been shown to be modest in other studies, such as response to radon information provided by the Environmental Protection Agency. However, the agency believes that reformulation of foods, which were not estimated in this benefit analysis, will increase the size of the total benefits. FDA acknowledges that this bias exists in the estimate but, as noted elsewhere in this document, FDA does not have sufficient information to estimate these effects and FDA is not altering its estimate based on this comment.

Although the estimate of the number of deaths avoided will not be adjusted based on the comments received, FDA acknowledges that a letter to the Department of Labor from the Office of Management and Budget (OMB) returning a rule which would lower permissible exposure limits for 375 substances in the construction and maritime industries has implications for

its estimate of the number of lives saved (Ref. 2). In that letter, OMB took note of a series of papers and books that estimated the effect of wealth on health. They noted that, "Richer workers on average buy more leisure time, more nutritious food, more preventive health care, and smoke and drink less than poorer workers." Thus, money spent by society to improve nutrition labeling will not be spent in other areas such as smoke detectors and airbags which will reduce risk. OMB cited a U.S. Court of Appeals decision which in turn cited research showing that each $7.5 million in additional regulatory expenditures may result in one additional death from lowered income.

The relationship between income and death is still somewhat controversial. In a recent article, researchers found that the effect is likely if the income reduction is permanent, as opposed to transitory (Ref. 3). Keeney has examined the extent to which the mortality effects on income changes are greater for poorer people than for richer people (Ref. 7). As the expenditure on nutrition labeling is a one-time expenditure affecting all consumers very slightly, it is likely that it is a transitory expenditure. On the other hand, because food expenditures account for a significantly larger share of the family budget for poorer families, the cost of these regulations are likely to have larger impacts on those families. Thus, it is unclear whether or not these expenditures will, in fact, increase some deaths while saving others. Nevertheless, FDA has estimated the possible effects this potential bias could have on the benefit estimate.

FDA's final estimate of additional regulatory costs resulting from the 1990 amendments is $1.6 to $2.7 billion. This would result in between 216 and 360 additional deaths which should be subtracted from FDAs estimate. Based on the Keeney estimate of one death for each $7.5 million of cost, the final estimates for the total deaths avoided as a result of the 1990 amendments are between 12,542 and 12,689 (from 12,902 estimated in the 1991 RIA proposal, Table 13, 56 FR 60856 at 60871). Life-years gained are reduced to between 78,672 and 79,577 (from 80,930, also in Table 13). The results of these changes affect the total benefits very slightly with the new range being $4.5 to $21 billion.

D. Quantification of Health Response

62. One comment argued that the average medical care costs estimated in Table 14 (56 FR 60856 at 60871) should not be discounted at a 5 percent inflation rate because the rising costs of medical care have been increasing 10.5 percent in recent years.

The agency agrees that the costs of medical care have been rising at approximately 10.5 percent. If this trend were to continue, however, a net of 5.5 percent increase (10.5 percent medical care cost inflation minus 5 percent general inflation) could be added to these costs, although future cost increases are difficult to predict, and the agency does not wish to infer that great precision accompanies these estimates. The agency notes that medical care costs estimated in the 1991 RIA proposal may be over or underestimates of actual medical care costs. That is, because some people who will not get cancer or CHD will get other illnesses that will result in medical care costs, using the total cost savings from reduced cancer and CHD cases is an overestimate. Because the agency was unable to net out increases in medical care from other diseases, it overestimated medical care cost savings. Thus, the agency acknowledges that there is a bias in both directions for the medical care cost estimate. Because it is not possible to estimate the net direction of these biases, however, the agency will not make further adjustments in these numbers. Finally, the agency's estimates of the benefits of nutrition labeling derive primarily from the willingness-to-pay for increased longevity, not from nonfatal medical care costs.

63. One comment expressed the view that the willingness-to-pay generated benefits of the 1990 amendments of $3.6 to $21 billion are for nonmedical outlays only.

FDA disagrees with this comment. In fact, the willingness-to-pay estimates of health benefits in the 1991 RIA proposal are individual dollar amounts that market studies demonstrate consumers (and workers) will pay to reduce the probability of death from these illnesses. Many people are willing to pay to reduce the probability of death and illness, and these payments include expected expenditures on medical care as well as other types of disability, such as pain and sickness. As noted earlier in this document, however, the total benefit estimates do not cover the cost savings from illnesses that do not result in death, which are estimated in the section on medical care cost savings. Thus, no change in the benefit estimate will be made as a result of this comment.

64. One comment pointed out that a willingness-to-pay model is not anchored in any real occurrence in the marketplace and reflects only a subjective valuation of good health. This comment added that risk is not traded in the marketplace.

The agency disagrees with this comment. The agency believes that willingness-to-pay estimates represent the individual's valuation of loss of productivity, medical care costs, pain and suffering, and other utility losses as demonstrated in economic literature. In this case, the decisions reflect payments to reduce the risk of death rather than using those resources for other goods.

FDA also believes that risk, including health risk, is ubiquitously traded in the marketplace. For example, expenditures on seatbelts, airbags, airline safety, safety caps on medicine, preventive check-ups, suntan lotion, and a multitude of other factors represent market expenditures on risk reduction. Many of the studies conducted to estimate willingness-to-pay to avoid death were based on the workplace transactions by estimating wage differentials for jobs with varying levels of risk and wages. Therefore, the willingness-to-pay figures for reductions in the probability of death are strongly grounded in economic theory such that the agency will not change the benefit estimate based on this comment.

65. One comment suggested that "hard figures" such as lost productivity should be used instead of willingness-to-pay estimates.

FDA disagrees with this comment because the use of such "hard figures" alone (productivity) will ultimately undervalue the total utility of reducing risk to the individual as it does not include the utility derived from reduced medical care costs and pain and sickness. The agency believes that the willingness-to-pay methodology is strongly grounded in economic theory and is the conceptually correct method to estimate these health benefits. Therefore, no change will be made to the benefit estimates based on this comment.

66. One comment contended that the quantitative estimate provided in the 1991 RIA proposal for the amount and value of reduced risk were too low because: (1) The estimate chosen for the value of risk reduction (value of life) from secondary studies was low because the mean of these type of studies was not chosen; (2) the estimate for value of risk reduction did not include the impact of recent inflation; (3) the estimate for the value of risk reduction did not include growth in real income before 1990; and (4) the estimate for value of risk reduction did not include future real growth of income.

FDA does not agree that the estimates chosen for the value of risk reduction, $1.5 to $3 million, from secondary

studies is necessarily low. Market studies of willingness-to-pay to avoid death have produced a range of values—some higher and some lower than the values used in this study. In order to capture this diversity, FDA used a wide range of benefits. Thus, FDA is unconvinced that sufficient data are either available in the literature or were in the comments to warrant changing these estimates.

As to the second point, FDA agrees that some inflation has occurred since the publication of the study that the agency used to estimate the value of risk reductions. The study's results were calculated in 1986 dollars (Ref. 4) and inflation from 1986 to 1991 was 16.5 percent (not 15.5 percent as mentioned in the comment). In addition, the comment noted that there have been increases in real personal disposable income since 1986. Real personal disposable income has increased from 1986 to 1990 by 8.5 percent, not 10 percent as cited in the comment (Table B–25 in the Economic Report to the President (Ref. 6)). To the extent that individuals can now purchase 8.5 percent more goods than they could in 1986, it is likely that they would be willing to pay more for risk reduction as well. Updating the range of estimates noted above of $3.5 to $21 billion to account for inflation and real personal disposable income yields the new range of $4.4 to $26.5 billion.

The comment also noted that FDA should include in the benefits estimates future real growth of income because if income continues to grow, people in the future will purchase more risk reduction. FDA disagrees with using long-term real growth of income to increase benefits. The benefits estimate derives from the choice that is made by individuals today. That choice reflects the amount of money people are willing to give up today to reduce risk in the future. Those estimates reflect individuals subjective evaluation of both their future health states as well as their assessment of their future income changes that will occur as a result of the regulation. If FDA were to forecast future growth in personal income and estimate the income/risk trade-offs (income elasticity of demand for risk reduction) that would be made for each future period, it would result in double counting. Again, this would be true as people implicitly account for future income growth in decisions made today. Furthermore, as income rises, people may choose to add even more labeling information at some time in the future but that would represent a separate choice with separate marginal costs and benefits.

FDA concedes, however, that choices that are made in most, if not all, willingness-to-pay studies associated with risk reduction are reflective of individuals valuation of their own change in probability of risk of death. They do not include the individual's altruistic expenditures to reduce risk for future generations. This effect is expected to be small for this regulation, however, as benefits and costs are estimated for over 20 years.

E. Health Claims

67. One comment expressed concern that FDA had ignored some fundamental findings from consumer behavior studies and the economics of information. It also stated that approval of health claims should be done on a cost-benefit basis rather than by consensus. The comment noted that allowing partial information produces a more efficient marginal adjustment process in the market than requiring full information. The comment noted that it did not believe there was such a thing as "Gresham's Law" (which essentially says that "bad" money drives out "good" money) of health claims in advertising.

The agency does not necessarily disagree with this assessment of the state of the economics of information. However, section 403(r)(3) of the act requires "substantial scientific agreement" for approval of a health claim for conventional food. The standard for substances in dietary supplements under section 403(r)(5)(D) of the act will be determined in accordance with the DS Act. The agency believes that the final rules for health claims are as flexible as is possible. Also, the agency notes that there is a set period of time for Government review of petitions for authorization to make additional health claims.

On the issue of whether or not there is a "Gresham's Law" with respect to advertising, the agency notes the widespread persistent use of the misleading "percent fat free" advertising. Thus, it is not clear whether or not "good" advertising in terms of being truthful and not misleading will ultimately drive "bad" advertising from the marketplace without regulation. Thus, FDA does not believe that this comment affects the ultimate benefits from the 1990 amendments and will not change its assessment based on the comment.

There is an opportunity cost of the choices made with respect to health claims and nutrient content claims. Opportunity costs of the regulation of these claims include the benefits foregone by not choosing an alternative option. Some of these costs arise from the statute itself, and some arise from the interpretations made in these regulations. If firms are either prohibited from making certain kinds of claims, or if the incentives are such that firms make fewer valid health claims or nutrient content claims, there is a cost imposed on society in that some valuable information may not be conveyed to consumers. For instance, if firms find that the required disclosures surrounding health claims are too cumbersome, they may find that this adversely affects the marketing of their product and fail to make a valid health claim.

In fact, FDA has no data to evaluate the potential market outcomes that would arise with alternative regulatory choices with respect to health and nutrient content claims. Although FDA has benefited from numerous comments on the subject, including a lengthy comment from the Federal Trade Commission, no comments have been able to show the quantitative outcomes of allowing more health claims in a different format or allowing more flexible use of nutrient content claims. However, although these rules are final, FDA will continue to evaluate information that will help refine these rules and encourages interested parties to submit such information.

V. Summary

FDA has evaluated comments on the costs and benefits of the impact of the changes in the food label occurring as a result of the 1990 amendments. The benefits of the 1990 amendments and the implementing regulations include decreased rates of cancer, CHD, osteoporosis, obesity, hypertension, and allergic reactions to food. As consumers are given more informative labeling in an improved format, uncertainty and ignorance concerning the ingredient and nutrient content of the foods they eat will decrease, and some consumers will select more nutritious, healthier foods. Also, the creation of consistent metrics and definitions, such as standardized serving sizes and nutrient content claim definitions, that consumers can use to judge the nutritional aspects of foods will encourage manufacturers through competition to reformulate their products into healthier foods. Thus, even those consumers who may be unaware of the effects of diet on health will inadvertently eat a better diet.

The model chosen to estimate these benefits focused on the two largest health problems, cancer and CHD (Ref. 5). This model involved the following three-step estimation process:

(1) Estimate changes in consumer purchase behavior and resulting changes in nutrient intakes as a result of receiving new nutrient information about foods. Some comments stated that consumers will not use labels at all, and some comments asserted that many more changes will come about than those that FDA estimated. A number of comments noted particular bias in the FDA/Giant SDA study. Although FDA agrees that there is bias both in the SDA study and in applying the results of the SDA study to the benefits of the 1990 amendments, no comments provided a sufficient basis either to replace or amend the study's result in this RIA.

(2) Estimate the changes in health states that would result from consumers' changes in nutrient intakes, particularly for reduced incidence of cancer and CHD. Again, FDA was presented with a number of comments on the changes that will result from changed diets, but none were convincing. Many comments were directed at the Browner model which was incorporated into FDA's benefit estimate in this section of FDA's analysis. The comments focused on the fact that nutrition labeling and other components of the 1990 amendments are estimated in FDA's model to make only a relatively small decrease in the number of cases of CHD and cancer and the deaths associated with them. However, FDA is unpersuaded by these arguments. The Browner model is well documented and contains realistic health assumptions. However, FDA did account for studies cited by OMB that demonstrated that regulatory expenditures may cause increased death. This resulted in FDA's estimate of lives saved and life-years saved decreasing by very small amounts, to between 12,542 and 12,689 (from 12,902 estimated in the 1991 RIA proposal, Table 13, 56 FR 60856 at 60871) and to between 78,672 and 79,577 (from 80,930, also in Table 13) for the number of life-years saved.

(3) Estimate the value of changes in health states in terms of life-years gained, number of cases and deaths avoided, and the dollar value of such benefits. FDA has been persuaded by some of the arguments that the benefits are underestimated in this component of the analysis. Specifically, the agency has adjusted for inflation and for the growth of real personal disposable income that occurred in the 4 years between when the estimates were cited in the economic literature and the time the 1991 RIA proposal was concluded. Coupled with changes made to the number of life-years and lives saved mentioned above, these adjustments change the benefits to $4.4 to $26.5 billion (discounted at 5 percent over a 20-year period).

FDA also evaluated comments on costs of the 1990 amendments and has amended its cost estimates based on these comments. The total costs of food labeling regulations range from $1.4 billion to $2.3 billion (discounted at 5 percent), depending on the frequency of reanalyzing products, excluding the cost of labeling raw fruit, vegetables, and fish, and assuming a 15-month compliance period for nutrition labeling and nutrient content claims ending in May 1994. If a discount rate of ten percent is used, total costs are estimated between $1.3 and $1.8 million. These costs include costs to food manufacturers and food service establishments. Costs to Government entities are estimated to be $163 million. Costs to dietary supplement manufacturers were not included in this estimate because of the moratorium imposed by the DS Act.

FDA believes that the study of the costs and benefits of food labeling is as accurate as possible for a forward looking study of the costs and benefits of regulatory action. FDA published the initial study in the Federal Register and received over 300 comments on it. As a result of the comments and new information, FDA revised its figures upward for both costs and benefits. In addition, FDA acknowledges that many deficiencies remain in these estimates because there are elements of both costs and benefits that remain unquantified. Nonetheless, the purpose of the RIA is to estimate the general magnitude of these effects in accordance with Executive Order 12291 and to determine whether the benefits of this action exceed the costs, and FDA has met that burden. With the exception of reformulation, FDA has examined the unquantified costs and benefits and believes that they are likely to be small relative to those that have been quantified and are not likely to change the estimates significantly.

Furthermore, the analysis contains assumptions that are subject to challenge, and many of the comments did so. However, where neither data nor convincing evidence were submitted to contradict the assumptions, FDA has not changed them. Finally, FDA advises that the dollar amounts estimated in the final RIA are not exact amounts but rather reasonable estimates of the impacts of nutrition labeling on U.S. society. The final RIA demonstrates that although this action is expensive, the likely benefits to U.S. consumers substantially exceed the costs that shareholders, taxpayers, and consumers will ultimately bear.

Food Labeling: Nutrient Content Claims, Definition of Term: Healthy

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA) is proposing to amend its food labeling regulations to establish a definition for the term "healthy" under the Federal Food, Drug, and Cosmetic Act. Elsewhere in this issue of the **Federal Register**, the agency is publishing a final rule to revise 21 CFR part 101 which establishes provisions for general principles, petitions, and definition of terms for nutrient content claims. This proposal will provide a definition for the implied nutrient content claim "healthy" for individual foods and for meals and main dish products and provide for its use on the food label. This action is in response to the Nutrition Labeling and Education Act of 1990 (the 1990 amendments).

DATES: Written comments by March 8, 1993. The agency intends that any final rule that may issue based on this proposal become effective on the same date as the final regulations for the General Principles for Nutrient Content Claims, promulgated under the provisions of the 1990 amendments and published elsewhere in this issue of the **Federal Register**.

ADDRESSES: Written comments may be sent to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1-23, 12420 Parklawn Dr., Rockville, MD 20857.

SUPPLEMENTARY INFORMATION:

I. Introduction

In the **Federal Register** of November 27, 1991 (56 FR 60421), FDA published a proposal entitled, Food Labeling: Nutrient Content Claims, General Principles, Petitions, Definition of Terms (hereinafter referred to as the general principles proposal) that would, among other things, establish general principles for the use of claims describing the nutrient content of foods and define certain nutrient content claims and provide for their use on food labels.

In the same issue of the **Federal Register** (56 FR 60478), FDA also published a proposed rule entitled "Food Labeling: Definitions of Nutrient Content Claims for the Fat, Fatty Acid, and Cholesterol Content of Food" (hereinafter referred to as the fat/cholesterol proposal) to define and provide for the proper use of the nutrient content claims for fat, saturated fatty acids, and cholesterol.

Both the general principles proposal and the fat/cholesterol proposal were issued in response to the 1990 amendments (Pub. L. 101-535). With respect to nutrient content claims, the 1990 amendments amended the Federal Food, Drug, and Cosmetic Act (the act) by adding section 403(r)(1)(A) (21 U.S.C. 343(r)(1)(A)), which states that a food is misbranded if it bears a claim on its label or in its labeling that either expressly or implicitly characterizes the level of any nutrient of the type required to be declared as part of the nutrition labeling, unless such claim is made in accordance with section 403(r)(2) of the act.

In the general principles proposal, the agency proposed that an implied nutrient content claim is one that describes the food or an ingredient therein in such a manner that leads a consumer to assume that a nutrient is absent or present in a certain amount (e.g., "high in oat bran"), or that the food because of its nutrient content may be useful in achieving a total diet that conforms to current dietary recommendations (e.g., "healthy") (56 FR 60421 at 60423).

The agency stated that because of the large variety of statements that could be considered to make implied claims and because of the resource constraints and strict timeframes under which the rulemaking was proceeding, it was not proposing to adopt regulations that authorize any implied claims at that time. However, the agency solicited comments and information concerning specific implied claims. The agency stated that if it received sufficient information in comments, it would consider providing for specific implied claims in the final regulation. Alternatively, it said, the agency might defer action on implied claims until after the rulemaking required by the 1990 amendments was complete.

In response to the general principles proposal, the agency received a number of comments on implied claims, including some specifically on the term "healthy." Elsewhere in this issue of the **Federal Register** FDA is publishing a final rule (the general principles final rule) based on the general principles proposal and the fat/cholesterol proposal. In the general principles final rule, the agency has determined that the term "healthy" is an implied nutrient content claim when it appears on the label or in labeling in a nutritional context, that is, when it appears in association with an explicit or implicit claim or statement about a nutrient, such as "healthy, contains less than 3 g of fat." Alternatively, use of the term "healthy" when not an implied claim will be reviewed under the general misbranding privisions. Such a statement suggests that the food may be useful in maintaining healthy dietary practices. Because of the complex nature of the term, the agency has determined that it was not possible to arrive at a final regulation for a definition of the term "healthy." Therefore, the agency is proposing a definition of the term. The agency advises that it intends to make any final rule that derives from this rulemaking effective on the same date as the general principles final rule and the final rule on mandatory nutrition labeling. If for some reason, however, the final rule has not been issued, "healthy" would be subject to the general nutrient content claim requirements for implied claims or the general misbranding clause.

II. Comments and Agency Response

1. Some comments asserted that the term "healthy" may be understood by consumers in some contexts to convey an implied health claim and should, in those instances, be regulated as an implied health claim. One of these comments asserted that the extent to which the term "healthy" implies health benefits depends on the context of the entire label. The comment specifically asserted that the term "healthy," when it is standing alone or is in a brand name, definitely implies to the consumer that the food has a direct beneficial effect on one's health.

Many other comments asserted that the term "healthy" is an implied nutrient content claim. Some comments stated that the context surrounding the use of the term "healthy" frequently conveys a strong message to consumers about the nutrient content of a food. However, one of these comments further stated that the term "healthy" can also appear in a context that does not imply nutrient content. The comment urged FDA, therefore, to consider the textual use of the term when determining whether it constitutes an implied nutrient content claim.

A similar comment asserted that the term "healthy" is misleading when it appears in a brand name of a food but is combined with a descriptor (nutrient content claim) or used in a context that is susceptible to a "unique" inference (e.g., "Healthy One"). The comment stated that the implication is not only that this labeled food is healthy, but that it is the only healthy product and other products of a similar type are unhealthy. The comment supported this argument by citing the results of a poll in which people were presented with two brand names of soup and asked which soup was "better for you." The soups were equivalent in nutritional content. When presented with one brand name that contained the term "healthy" in conjunction with a descriptor implying that the product was unique and one brand name that made no reference to "health" or "healthy," 67.7 percent of the respondents stated the soup whose brand name contained "healthy" was "better for you." The comment suggested that the term "healthy" not be allowed to appear in any context that suggests that the food is uniquely "healthy" as compared to similar products, unless such a claim is true.

FDA agrees with the comments that asserted that the context in which the term "healthy" is used is a critical factor in determining whether the term constitutes an implied nutrient content claim. As discussed in the general principles final rule, FDA believes that the term "healthy" constitutes an implied nutrient content claim only when it appears in a nutritional context. Such a context is established when the term "healthy" appears in association with an explicit or implicit claim or statement about a nutrient. Accordingly, the label or labeling statement "a healthy, low fat meal" would constitute an implied nutrient content claim. Likewise, the statement "low in saturated fat" on the label of a food with the brand name "Healthy Mountain" would place the term "healthy" into a nutritional context and subject it to the provisions of section 403(r) of the act.

On the other hand, FDA believes that in a context that refers to general dietary guidance, "healthy" is not an implied nutrient content claim. For example, in the statement "eat lots of fruit and vegetables for a healthy diet," the term "healthy" does not imply the absence of a nutrient or the presence of a nutrient in a particular amount and would therefore not be a claim subject to the requirements of section 403(r) of the act.

Further, FDA is not convinced that brand names in which "healthy" appears in a phrase with a term that suggests that the product is uniquely healthy, such as "Healthy One," invariably imply that the specified product is superior to products of a similar type, or that the consumer should choose that product because it conforms to current dietary guidelines. The comment's interpretation of its survey is that some brand names that include the term "healthy" should be prohibited because of their context. However, FDA is not convinced that this interpretation of the study is appropriate. Because the study included only one sample involving "healthy," the agency has no way to distinguish between uses of "healthy" in various names. Accordingly, FDA is not granting the comment's request that "healthy" not be allowed to appear in a context that suggests that the food is uniquely healthy. FDA will evaluate such uses of the term on a case-by-case basis and take appropriate action if a particular use is false or misleading.

In addition, FDA advises that a statement containing references to both nutrient levels and a disease or health-related condition would constitute a health claim. As discussed in the final rule on general principles for health claims, published elsewhere in this issue of the **Federal Register**, a health claim is made when a label or labeling statement refers explicitly or by implication both to a nutrient present in the food and to a disease or health-related condition. The agency does not believe that the term "healthy" inherently implies that a food contains certain nutrients, or that the term inherently implies that the consumption of the product may reduce the risk of a disease or health-related condition. Instead, such implications are likely to be made only if the term "healthy" is accompanied by additional language or graphic material (e.g., logos, symbols, vignettes) that explicitly or implicitly suggests both a disease-related benefit and a nutrient context. For example, the statement "a low fat, heart-healthy food" on a food label or labeling implies that the food is useful in reducing the risk of heart disease because of its low fat content and would, therefore, be considered an implied health claim.

Consequently, the agency concludes that when the term "healthy" appears on a food label without the additional label statements that render it either a health claim or a nutrient content claim, it is not subject to the requirements of section 403(r) of the act. Instead, under such conditions, the use of the term "healthy" is subject to section 403(a) of the act, and whether it is misleading will be determined on a case-by-case basis. However, FDA advises that even though it is not establishing a regulation on use of the term "healthy" on labels and in labeling of foods under section 403(a) of the act, it believes that there are some foods on which the term would be misleading. These include foods in which the level of a nutrient exceeds the disclosure level established in new § 101.13(h) published elsewhere in this issue of the **Federal Register**. The agency considers that it is misleading for a label to include the term "healthy" when the food contains a nutrient at a level such that the food would not assist consumers in maintaining healthy dietary practices.

FDA seeks comment on whether it should adopt a regulation using its authority under the general misbranding sections of the act (201(n) (21 U.S.C. 321(n)), 403(a), and 701(a) (21 U.S.C. 371(a))), that provides further guidance on the circumstances under which use of the term "healthy" might be false or misleading and thus misbrand the product. The agency is concerned that when a label bears the term "healthy," even in the absence of statements that render the term an implied claim subject to the requirements of section 403(r) of the act, its implications about the consequences of consumption of the food will be misleading unless the food complies with some understood criteria. If comments support adopting such a regulation, FDA will consider doing so in the final rule that results from this proposal.

2. Some comments asserted that the term "healthy" should either be clearly defined or be prohibited to ensure that the term is used consistently and truthfully. Others asserted that the word "healthy" should be prohibited on food labels because it is misleading to consumers. One of these comments asserted that establishing a definition for "healthy" is impractical because what is "healthy" for one individual is not necessarily "healthy" for another. The comment noted that many of the nutritional needs of children are markedly different than the needs of adults. The comment also asserted that the scientific understanding of "healthy" is continually evolving.

Many comments suggested that the agency should define the term "healthy." A comment from industry stated that the term "healthy" should be defined to curtail the wide variety of products that are marketed as "healthy," when in fact the benefits that they provide in comparison to benchmark products are minimal. One comment asserted the agency should define and allow the use of the term "healthy" to give manufacturers who wish to use the term an incentive to improve the nutritional quality of their products.

One comment asserted that use of the word "healthy" as a descriptor should be encouraged and facilitated because it allows an evaluation of a total product, while it precludes unjustified focus on one nutritive aspect. The comment stated that promulgation of a standard will ensure a quality product, used in an informed way, by a consumer who has accurate information and justified reliance on the product as labeled.

A number of comments stated that there is little or no consistency in the way the term "healthy" is used in the marketplace today. One of these comments asserted that the term is used to describe a low sodium content in some instances and a low fat or saturated fat content in others. The comment noted that some products described as "healthy" may in fact contain a low level of one of these nutrients but still contain high levels of another (e.g., a peanut butter which contains less sodium than other brands but just as many calories and just as much fat). The comment further noted that, in some instances, the nutrient of concern is actually present in greater amounts than it is in similar products that are not described as "healthy" (e.g., one brand of frozen desserts labeled as "healthy" contains more sodium than regular ice creams and more fat than fat free ice creams). Another comment pointed out that the term "healthy" is also understood by some consumers to indicate that a food is free of pesticides.

Some comments stated that the uncontrolled use of the term "healthy" diminishes consumer confidence in FDA and in the truthfulness of the food label. One of these comments cited the results of a national survey conducted in February 1992, in which 1,007 individuals were interviewed concerning their interpretation of the word "healthy" as it appears on food labels. The comment reported that when asked what the word "healthy" on a food label says about an unspecified product, 33 percent responded that it means nothing, 24 percent responded that it means the product is good for you, 9 percent responded that it is an advertising ploy. Additionally, 9 percent of the respondents indicated that they don't believe that the product is actually healthy.

Several comments objected that the grandfathering of brand names that include the term "healthy" would create additional confusion in the marketplace. Some of these comments stated that unevenly restricting usage of the term "healthy" would allow one company to use a term like "healthy" in a brand name and preclude other manufacturers with equivalent or superior products from using the term. One comment also asserted that allowing the use of the term "healthy" through the grandfathering process would perpetuate a "good food/bad food" distinction. Another comment stated that such a policy would allow manufacturers of products with grandfathered brand names to continue to mislead consumers. One comment stated that leaving the term "healthy" undefined allows companies that used the claim in brand names before October 25, 1989, to continue using the term on foods that may not meet appropriate standards.

Some comments encouraged FDA to define "healthy" in a separate supplemental proceeding on an expedited basis, with an effective date that coincides with other implementing regulations. One comment suggested that such a rulemaking be done in conjunction with the U.S. Department of Agriculture's (USDA's) Food Safety and Inspection Service.

FDA has carefully reviewed these comments and tentatively concludes that a definition of the term "healthy" should be included in the implied nutrient content claim regulations. The number and variety of comments received in response to the appearance of the term "healthy" in the proposed definition of "implied nutrient content claim" has made the agency aware of the overwhelming interest that both consumers and industry have in regulating the use of this term. The agency agrees with those comments that asserted that there is little consistency in the way the term "healthy" is currently used in the marketplace and is concerned that this inconsistency is confusing to consumers. Because concern over the use of the term "healthy" is so great, and because there is a wide divergence of opinion on appropriate criteria, the agency is proposing a definition for this term.

In reaching this tentative conclusion, FDA considered the option of not defining the term "healthy." Under section 403(r)(2)(C) of the act, all undefined nutrient content claims will be prohibited except when they appear in the brand names of products that were initially marketed before October 25, 1989. Thus, if FDA did not define "healthy," it could continue to be used in grandfathered brand names as long as such use was not false or misleading under section 403(a) of the act. This would have meant that the inconsistent use of this term among grandfathered brand name foods would also continue. The agency believes that the situation that would have resulted would not only not be in the interest of consumers but would be inequitable, because one product would be able to bear the claim but a nearly identical product could not. (The agency emphasizes that this discussion does not apply to uses of "healthy" that are not implied nutrient content claims.)

FDA tentatively concludes that a more appropriate resolution to the problems cited by the comments is to define the term "healthy." The agency believes that, by providing a definition, it will ensure that the term is used consistently by various manufacturers, and that all manufacturers who market similar products are able to use the term "healthy" if the product meets the definition.

3. Some comments asserted that the term "healthy" is more appropriately applied to overall diets which include fresh fruits, vegetables, low fat dairy products, and grains rather than an individual food or "meal/main dish" product. These comments suggested that FDA prohibit the use of the term on food labels. One such comment stated that allowing the use of the term "healthy" on individual foods contradicts the Department of Health and Human Services and USDA "Nutrition and Your Health, Dietary Guidelines for Americans" 1990 (Dietary Guidelines) which states that almost any food that supplies calories and nutrients can be incorporated into a nutritious diet, and that it is the overall diet that is significant. While most comments that discussed "healthy" did not distinguish between its use on individual foods and its use on meals and main dishes, other comments asserted that allowing individual foods to be described as "healthy" perpetuates a "good food/bad food" image. A comment from a foreign government advised that its policy is not to allow food products to be described as "healthy," although their labeling may bear statements that the food can be consumed as part of a healthy overall diet. Another comment expressed concern that the representation of single foods or "meal/main dish" products as "healthy" could easily lead a consumer to over consume those products rather than consuming a variety of foods and thereby reduce the nutrient quality of his/her diet.

The agency tentatively concludes that it should not limit the use of the term "healthy" to reference the total diet. FDA believes that foods labeled with the term "healthy," whether they are individual foods, main dishes, or meals, can be used with a variety of foods to assist consumers in maintaining healthy dietary practices, that is, to achieve a total diet that conforms to current

dietary guidelines. One of the goals of the 1990 amendments was to encourage manufacturers to provide a wider selection of foods with improved nutrient content to facilitate diets that conform to guidelines. The agency tentatively concludes that appropriate criteria for use of the term "healthy" can be established to both encourage innovation and ensure that the term is not misleading.

While FDA is proposing a definition for "healthy" that includes the same criteria for all types of foods, the agency requests comments on whether it is more appropriate to establish criteria for the use of "healthy" on individual foods that are different from those for meals and main dishes, or whether use of "healthy" should be limited to meals and main dishes. Comments should suggest criteria appropriate for the recommended use and include data or other information to substantiate their recommendations.

4. The agency received numerous comments that suggested definitions for use of the term "healthy" on food labels. Several of those comments addressed the issue of what the term "healthy" is understood to mean or should be defined to mean when it appears on food labels. One comment stated that consumers associate the term "healthy" with fat, saturated fat, cholesterol, and sodium. The comment cited the results of a national survey that showed that 81 percent of the respondents thought that a food labeled as "healthy" was low in sodium and fat, 79 percent thought it was low in cholesterol, and 74 percent thought it was low in saturated fat and calories. Many of the comments that offered definitions for the term "healthy" included requirements for the levels of fat, saturated fat, cholesterol, and sodium. One of these comments stated that foods labeled with the term "healthy" should contain no more than 30 percent calories from fat, 10 percent calories from saturated fat, 60 milligrams (mg) or a significantly reduced amount of cholesterol, and 480 mg or a significantly reduced amount of sodium. A few comments suggested that FDA allow the term "healthy" to appear on foods that do not contain nutrients at levels exceeding the disclosure levels for sodium, fat, saturated fat, and cholesterol. Many comments asserted that a product labeled as "healthy" should additionally be "low" in at least one of these nutrients.

Many other comments suggested a stricter definition of "healthy" that would require that a product meet the "low" definition for sodium, fat, saturated fat, and cholesterol. Some comments also suggested additional criteria that a "healthy" product should be required to meet. One of these comments suggested that such a product be "low" in calories. Another suggested that such a product meet the "low" definition for sugars.

The agency has evaluated these comments. It tentatively agrees with those comments that stated that FDA should define the term "healthy" in a way that restricts the levels of those nutrients whose consumption should be limited in the total daily diet to levels that do not exceed the Daily Reference Values (DRV's) for those nutrients. The agency also tentatively agrees with those comments that suggested that the definition for "healthy" should focus on restrictions for fat, saturated fat, sodium, and cholesterol because these nutrients are of particular significance to public health. High intake of total dietary fat is associated with increased risk for obesity, some types of cancer, and possibly gall bladder disease. Excessive saturated fat consumption is a major contributor to total blood cholesterol levels, and the consumption of dietary cholesterol also contributes to total blood levels. An extensive body of evidence has established a relationship between high blood cholesterol and increased coronary heart disease. Accordingly, many health organizations have made recommendations for modifying dietary intake of fat, saturated fat, and cholesterol for the purpose of improving the public health (56 FR 60478 at 60482). According to the Dietary Guidelines, excessive dietary intake of sodium is one of several factors that may increase the risk of hypertension in some individuals. Hypertension currently affects one in three Americans and is associated with heart disease and stroke when uncontrolled (56 FR 60825 at 60834).

The agency has tentatively concluded that a definition of "healthy" that allows the term to appear on foods that contain amounts of fat, saturated fat, sodium, and cholesterol above the disclosure level would not assist consumers in maintaining healthy dietary practices and could result in an overall diet inconsistent with current dietary guidelines. Accordingly, FDA has tentatively concluded that a definition of "healthy" that permits levels of fat, saturated fat, sodium, and cholesterol that are above the disclosure levels would not be approiate. FDA believes that labeling of such products as "healthy" would be misleading to consumers.

Likewise, the agency is concerned that a definition of "healthy" that requires that a food be "low" in fat, saturated fat, sodium, and cholesterol may be too restrictive. Such a definition could disqualify many products that would be useful in maintaining a diet that conforms to current dietary guidelines. FDA also believes that although restricting the percentage of calories derived from fat and saturated fat to no more than 30 percent and less than 10 percent, respectively, is appropriate for overall diets, it is not appropriate for individual foods and is, therefore, not appropriate as a criterion for "healthy" on individual foods. However, as discussed in the general principles final rule in the definition for "low fat" and "low saturated fat" for meal and main dish products, no more than 30 percent of calories from fat and less than 10 percent of calories from saturated fat are used as a second criterion for the definitions for "low fat" and "low saturated fat," respectively. Therefore, under this proposal the criterion of no more than 30 percent of calories from fat or less than 10 percent of calories from saturated fat will apply to meal and main dish products bearing the term "healthy."

FDA is therefore proposing to amend new § 101.65 by redesignating paragraph (d) as paragraph (d)(1) and by adding new paragraph (d)(2) which provides that for the purposes of new § 101.65, the term "healthy" may be used to describe foods that do not exceed the disclosure level for sodium or cholesterol and are "low" in fat and saturated fat. This proposed definition of "healthy" limits fat and saturated fat in a "healthy" food because of the recommendations from leading health authorities that lowered consumption of fat and saturated fat is of importance in reducing the risk of certain diet-related diseases that are discussed above.

The agency believes that the foods that will be able to bear the term "healthy" under this definition will be of a sufficient number and variety to help consumers achieve a total diet that is consistent with current dietary recommendations.

FDA specifically solicits comments for evaluating whether this definition of "healthy" is appropriate.

The agency requests comments on whether the definition for "healthy" should include a requirement that the food be "low" in a third nutrient, i.e., cholesterol or sodium. Among other things, comments should address: whether a "low cholesterol" criterion is needed; if such a requirement is included in the definition will such foods as shellfish and crustaceans qualify to be labeled "healthy;" should such foods be labeled "healthy" in light of their cholesterol content?

In addition, comments should consider whether a "low calorie" criterion should be a part of the definition of "healthy." The agency has not included a calorie criterion in its proposed definition because there was not enough information in comments for FDA to determine that such a criterion is needed. However, dietary guidelines recommend that Americans maintain appropriate caloric intake for their body weight, and that overweight is a major public health problem. In light of these facts, FDA is seeking comment on what, if any, calorie criterion should be included. Should calories be a part of a requirement for a third nutrient at a "low" level, i.e., the food must be "low" cholesterol, sodium, or calories in addition to fat and saturated fat? Alternatively, should a "low calorie" criterion be required in addition to "low" in cholesterol or sodium?

FDA acknowledges that the definition of the term "healthy" that it is proposing in this document differs from the definition for the term proposed elsewhere in this issue of the Federal Register by the U.S. Department of Agriculture's Food Safety and Inspection Service (FSIS), which regulates the labeling of meat and poultry products. The Dietary Guidelines for Americans recommend choosing lean meat and poultry as part of a balanced diet. The agency requests comments on whether a definition of healthy which excludes lean meat and poultry will help consumers to achieve a total diet that is consistent with current dietary recommendations. Comments should suggest appropriate criteria for a single definition for all foods or separate definitions for foods of animal origin such as meat and poultry and provide rationale and other information to substantiate their suggestions. The agency also requests comment on whether it is necessary that the two agencies provide uniform criteria for use of this term or whether different definitions may be appropriate.

5. Some comments suggested that a product labeled as "healthy" should provide key nutrients in addition to being "low" in sodium, fat, saturated fat, and cholesterol. Another such comment specified that the product should be "high" in two of the four micronutrients (i.e., Vitamin A, Vitamin C, calcium, and iron). Another of these comments suggested that a "healthy" food contain either at least 5 percent of the Reference Daily Intake (RDI) of at least two vitamins or minerals required to be included in the nutrition label or at least 10 percent of the RDI of at least one such vitamin or mineral. One such comment suggested that FDA require that the food provide 10 percent of the reference levels of fiber and two other vitamins or minerals. The concept that a definition for the term "healthy" should include a requirement for fiber was also supported by the results of the national survey that is discussed above in greater detail. That survey found that 72 percent of the respondents believed that the term "healthy" implied that the food was a source of fiber.

FDA specifically requests comments on the appropriateness of including a requirement in the definition of "healthy" that the food supply a certain amount of specified essential vitamins, minerals, or other nutrients (e.g., protein). There is not significant agreement among the comments as to the specific nutrients that should be included in such a requirement. The agency does not believe that it currently has enough information to conclude that such a requirement would be useful if a definition for use of the term "healthy" were to be adopted.

6. Some comments specifically addressed use of the term "healthy" to describe meals and main dish products (referred to in the general principles proposal as meal-type products). One comment suggested that the term "healthy" be allowed to appear in the labeling of a meal-type product that contains not more than 19 grams (g) of fat, 6 g of saturated fat, 75 mg of cholesterol, or 600 mg of sodium per product. The comment also stated that these criteria would reflect 25 percent of the proposed DRV for each of the nutrients and would provide an adequate amount of nutrients when considering that consumers have approximately four important eating occasions on a daily basis.

Another comment asserted that in addition to nutrient criteria, the use of the term "healthy" to describe meal products should be restricted to foods that: (1) Provide at least 500 calories per serving, and (2) are composed of foods from at least three of the major food groups.

After reviewing these comments, the agency has tentatively concluded that there is a need to provide for use of the term "healthy" to describe the levels of multiple nutrients in a meal or main dish product.

FDA tentatively agrees with those comments that suggested that the definition for "healthy" on meals and main dish products should focus on restrictions for fat, saturated fat, sodium, and cholesterol, because these nutrients are of particular significance to public health. Moreover such a definition is consistent with the definition of "healthy" that FDA is proposing for individual foods. The agency does not agree, however, with the comment that suggested that the definition for "healthy" on meal products should be restricted to those products that provide at least 500 calories per serving and are composed of foods from at least three of the major food groups. Such a criterion would preclude many products that otherwise meet the requirements for "healthy" and are beneficial in assisting consumers in maintaining diets within current dietary guidelines from bearing a "healthy" claim. Thus, the agency has tentatively concluded that the proposed definition for "healthy" on individual foods can also be applied to meal and main dish products, because, as discussed in section II. of this document (comment 4) such a definition places emphasis on the limitation of fat and saturated fat in a "healthy" meal or main dish product. Therefore, the proposed definition conforms to recommendations from leading health authorities to limit total daily consumption of fat and saturated fat. Accordingly, FDA is proposing to define the term "healthy" in new § 101.65(d)(2) to describe a meal product as defined in new § 101.13(l) or main dish product as defined in new § 101.13(m) that meets the definition for "low" for fat and saturated fat and that does not exceed the disclosure level for cholesterol or sodium.

The agency believes that the meal and main dish products that will be able to bear the term "healthy" under this definition will be of a sufficient number and variety to help consumers achieve a total diet that is consistent with current dietary recommendations. FDA specifically solicits comments for evaluating whether this definition of "healthy" is appropriate for meal and main dish products.

In addition, as discussed in the general principles final rule, because of the unique nature of restaurant foods, the agency requests information on the extent to which such a definition for "healthy" would be appropriate for meals, main dishes, and individual foods served in restaurants. Specifically, the agency requests information on: (1) Whether such foods have characteristics which would make such a definition for "healthy" difficult to meet, and (2) if a different definition for "healthy" on such foods would be confusing to consumers.

7. One comment requested that FDA specifically include in the language of the regulation on "healthy" that a food need not be specially processed, altered, formulated, or reformulated to qualify for use of the term on its labeling.

The agency advises that the requirement that a food be specially processed, altered, formulated, or reformulated compared to other foods applies to "free" and "low" claims (new § 101.13(e)). The requirement is triggered when these claims appear before the name of the food to prevent the consumer from being led to believe the product differs from others of that type when that is not the case. FDA is not aware of a similar use of the term "healthy." The comment did not provide information on or examples of misleading labels. Therefore, the agency tentatively concludes that a provision similar to that in new § 101.13(e) is not needed for "healthy." However, it requests comments on this issue. If information in comments demonstrates that such a provision is warranted, FDA will consider including it in the final regulation.

III. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the **Federal Register** of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the **Federal Register**. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (address above), and a notice will be published in the **Federal Register** announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

Because any changes that result from this proposal will not need to be made until the same date as the other changes required by the nutrient content claims final rule (May 8, 1994), this proposal will not add any additional meal costs to those considered in the RIA.

IV. Environmental Impact

The agency previously considered the environmental effects of the action being taken in this final rule. As announced in its nutrition labeling proposed rules published in the **Federal Register** of November 27, 1991 (56 FR 60366 et al.), the agency determined that under 21 CFR 25.24(a)(8) and (a)(11), these actions are of a type that do not individually or cumulatively have a significant impact on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement was required.

V. Request for Comments

Interested persons may, on or before March 8, 1993, submit to the Dockets Management Branch (address above) written comments regarding this proposal. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

List of Subjects in 21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

Therefore, under the Federal Food Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, it is proposed that 21 CFR part 101 be amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.65 is amended by adding new paragraph (d)(2) to read as follows:

§ 101.65 Implied nutrient content claims and related label statements.

* * * * *

(d) * * *

(2) For purposes of this section, the term "healthy" may be used on the label or in labeling of a food, including a meal as defined in § 101.13(l) or a main dish as defined in § 101.13(m), provided:

(i) It meets the definition of "low" for fat and saturated fat;

(ii) Neither cholesterol nor sodium is present at a level exceeding the disclosure levels as described in § 101.13(h) for an individual food, meal product, or main dish product, as appropriate; and

(iii) The food complies with definitions and declaration requirements established in this part for any specific nutrient content claim on the label or in labeling.

Dated. October 26, 1992.

David A. Kessler,

Commissioner of Food and Drugs.

Louis W. Sullivan,

Secretary of Health and Human Services.

Food Labeling; Declaration of Ingredients—Common or Usual Name Declaration for Protein Hydrolysates and Vegetable Broth in Canned Tuna; "and/or" Labeling for Soft Drinks

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA) is proposing to: (1) Amend the standard of identity for canned tuna (21 CFR 161.190) to require the term "(includes soybeans)" as part of the name used to declare the ingredient vegetable broth when soybeans are one of the vegetable extractives used to make the vegetable broth; (2) amend the common or usual name regulations for protein hydrolysates (new § 102.22) to require the term "contains glutamate" as a part of the common or usual name of autolyzed yeast extracts and certain hydrolyzed proteins; and (3) amend the food labeling regulations in § 101 4 (21 CFR 101.4) to allow "and/or" labeling for the declaration of sweeteners in soft drinks. These proposed requirements are in response to issues that were raised in comments to the proposed rule on ingredient labeling that was published in the Federal Register of June 21, 1991 (56 FR 28592).

DATES: Written comments by March 8, 1993. The agency proposes that any final rule that may issue based on this proposal, become effective May 8, 1994.

ADDRESSES: Written comments may be sent to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1-23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Elizabeth J. Campbell, Center for Food Safety and Applied Nutrition (HFS-155), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202-205-5229.

SUPPLEMENTARY INFORMATION:

I. Background

In the Federal Register of June 21, 1991 (56 FR 28592), FDA published a proposed rule (hereinafter referred to as the 1991 ingredient labeling proposal) to implement certain amendments to the Federal Food, Drug, and Cosmetic Act (the act) that were made in section 7 of the Nutrition Labeling and Education Act of 1990 (the 1990 amendments) (Pub. L. 101-535). These amendments require the listing of the ingredients of standardized foods and the declaration of certified color additives in foods. In the 1991 ingredient labeling proposal, FDA also proposed other actions concerning ingredient labeling in response to written and oral comments received on an advance notice of proposed rulemaking published in the Federal Register of August 8, 1989 (54 FR 32610), as part of the food labeling initiative of the Secretary of the Department of Health and Human Services. The agency received over 700 letters in response to the 1991 ingredient labeling proposal, each containing one or more comments. Elsewhere, in this issue of the Federal Register, the agency is publishing a final rule (the declaration of ingredients final rule) responding to the majority of those comments. However, some comments to the 1991 ingredient labeling proposal presented new information on two matters that the agency had addressed in the 1991 ingredient labeling proposal: the declaration of glutamate when a component of certain protein hydrolysates and the use of "and/or" labeling for sweeteners in soft drinks. Other comments raised a new issue that had not been addressed in the 1991 ingredient labeling proposal: the declaration of vegetable extractives in vegetable broth in canned tuna.

After reviewing the information provided in these comments, as well as other information available to the agency, FDA has tentatively concluded that additional labeling requirements are necessary and appropriate to ensure that ingredient labeling with regard to these issues is accurate, not misleading, and assists the consumer in making informed purchase decisions. With respect to each of the three issues, however, FDA has concluded that it would not be appropriate to simply include the regulations that it is proposing in the final rule on declaration of ingredients. The agency had not specifically addressed the appropriate declaration of the vegetable extractives in vegetable broth when present in canned tuna in the 1991 ingredient labeling proposal. Moreover, in that proposal, FDA had flatly asserted that declaration of glutamate would not be possible, and its only action with regard to the use of "and/or" labeling of sweeteners in soft drinks was to deny a longstanding petition. Thus, the agency determined that the best approach to addressing these issues was to publish a proposed rule and to permit an opportunity for comment on its tentative decisions to establish additional labeling requirements with regard to these three matters.

II. The Proposal

A. Declaration of Soybeans as Ingredients of Vegetable Broth Used in Canned Tuna

The standard of identity for canned tuna (§ 161.190 (21 CFR 161.190)) permits the inclusion of several optional ingredients. One of the optional ingredients provided for in § 161.190(a)(6)(v) is designated as "vegetable broth" and is permitted to be declared in the ingredient list as "vegetable broth." As required by the standard, vegetable broth consists of two or more of the vegetable extractives as specified in § 161.190(a)(6)(v). In accordance with the 1990 amendments, FDA proposed in the 1991 ingredient labeling proposal to amend the standard of identity for canned tuna (56 FR 28592 at 28634) to require that all mandatory and optional ingredients be declared in the ingredient list in accordance with the requirements of the applicable sections of parts 101 and 130 (21 CFR parts 101 and 130). Previously, only declaration of optional ingredients in standardized foods was required by the act

One comment interpreted the agency's implementation of the 1990 amendments to mean that FDA will require the listing of each vegetable that is in the vegetable broth in the order of predominance parenthetically following the term "vegetable broth" in the ingredient statement on the label of canned tuna. The comment stated its opposition to this approach. In support of its position, the comment pointed out that this method of listing the ingredients comprising vegetable broth in canned tuna would "intensify label crowding" and "create confusion as to whether or not whole pieces of vegetables are contained therein." This comment also stated that FDA should not require the listing of the components of vegetable broth in canned tuna.

As discussed in the declaration of ingredients final rule, FDA agrees that the listing of each ingredient comprising vegetable broth on the label of canned tuna could be lengthy and cumbersome. Furthermore, as stated above, the standard of identity for canned tuna permits the ingredient vegetable broth to be listed as "vegetable broth." Hence, the new regulations do not require full declaration of all of the ingredients of which the vegetable broth is comprised.

However, the agency notes that some manufacturers have interpreted the provision in § 161.190(a)(6)(v) that permits the use of "beans" as one of the vegetables extractives in making the vegetable broth used in canned tuna as including soybeans (Ref. 57). Soybeans generally are not classified as "vegetables" but as grains and belong to the general category of oilseeds. Thus, it is not likely that the term "vegetable broth" would be understood by most consumers to be a product that has been made from soybeans. Because some individuals have food sensitivities (including possible life-threatening reactions) to soy proteins (Ref. 58), consumers should be informed of the presence of soybean extractives in the broth. Therefore, FDA is proposing to amend the standard of identity in § 161.190(a)(6)(vi) to require that when soybeans are used in vegetable broth, this fact be declared parenthetically following the listing of "vegetable broth" in the ingredient statement of the label, as follows: "vegetable broth (includes soybeans)". If the vegetable broth serves as a flavor and has no flavor enhancing function in the food, the vegetable broth containing soybean extractives will be listed in the ingredient statement as "flavoring (includes soybeans)." (In the declaration of ingredients final rule the agency discusses its conclusions with respect to the functional effect of vegetable broth as a flavoring or flavor enhancer when used in canned tuna and the appropriate label declarations for such use.)

The proposed requirement to list soybeans as a constituent of vegetable broth is consistent with FDA's past policy regarding the listing of soybeans on canned tuna labels. In a letter to Protein Technologies International, FDA stated that when soybeans are used in the vegetable broth, their presence must be identified parenthetically following the term vegetable broth because of possible allergic reactions in some individuals to soy proteins (Ref. 57). FDA continues to believe that such information is essential to individuals with sensitivities to soybeans, and that the industry should continue to list soybeans on the label when it is contained in the vegetable broth.

FDA encourages, where practicable, the full disclosure of all ingredients on the labels of food products to promote clarity and to prevent confusion and misunderstanding on the part of consumers. The agency believes that listing of all the components of vegetable broth would be informative and useful to consumers.

B Label Declaration of Glutamate as a Component of Protein Hydrolysates

FDA stated in the 1991 ingredient labeling proposal that the agency was not aware of scientific evidence establishing that monosodium glutamate (MSG) causes severe adverse or life-threatening reactions (56 FR 28592 at 28600). Therefore, the agency tentatively found that there was no public health basis for requiring the declaration of free glutamates (i.e., salts of free glutamic acid such as MSG, monopotassium glutamate, etc.) that occur as components of protein hydrolysates.

Many comments to the ingredient labeling proposal urged the agency to reconsider its position and require declaration of the MSG component in protein hydrolysates for health reasons. (The agency notes that the glutamic acid portion of a protein hydrolysate may be present as salts other than the monosodium salt. Hence, the agency will use the generic term, "glutamate," to refer to all the salts of glutamic acid.) Most of these comments alleged that many people have allergic reactions, food intolerance, or sensitivity to glutamate and, therefore, want to avoid consumption of any amount of glutamate in food. One comment stated that its request for declaration of glutamate in hydrolyzed protein was based on some of the same information on which the agency had relied. The comment disagreed, however, with the agency's conclusion that glutamate as a component of a protein hydrolysate is safe. The comment also disagreed with the agency's belief that there is no scientific evidence to support a finding that glutamate in such amounts as may result from the hydrolysis of a protein can cause or trigger an allergic reaction, food intolerance, sensitivity, or any other measurable adverse health effect.

The agency disagrees with these comments. As the agency indicated in the 1991 ingredient labeling proposal, there is some evidence in case reports and in the scientific literature that dose-dependent, mild reactions to glutamate occur in a limited portion of the population. However, no verifiable scientific data have been presented to the agency that establish that low doses of glutamate, as found in protein hydrolysates, cause severe adverse or allergic reactions in sensitive individuals. Further, none of the comments provided scientific data to support allegations of allergic reactions, food intolerance, or sensitivity responses due to the ingestion of glutamate as a component of protein hydrolysates.

Thus, there is no public health basis for requiring declaration of glutamate present in a food as a component of hydrolyzed protein and the agency's tentative decision to require the declaration of glutamate is not based on any failure of the labeling to reveal material facts regarding consequences that may result from the customary or usual use of the ingredient.

However, some comments to the 1991 ingredient labeling proposal raised other issues not related to public health concerning the declaration of glutamates. These comments urged that FDA require declaration of the glutamate component in protein hydrolysates because of public confusion, misunderstanding, and suspicion caused by lack of informative labeling of protein hydrolysates. Most of the comments expressed concern that foods that do not have glutamate declared in the ingredient label or are labeled "no added MSG" do indeed contain some form of glutamate. Several comments stated that MSG could conceivably be a component of any ingredient in the finished food. Other comments stated that all protein hydrolysates, regardless of the degree of hydrolysis, contain high levels of glutamate. Finally, some comments indicated that consumers believe manufacturers add protein hydrolysates that contain high levels of glutamate to food but do not declare the presence of glutamate on the label.

FDA did not consider these issues in the 1991 ingredient labeling proposal. After evaluating the information presented in these comments, FDA has tentatively concluded that the phrase "(contains glutamate)" is necessary to describe adequately the basic nature of certain protein hydrolysates and, thus, is proposing that this phrase be part of the common or usual name of certain protein hydrolysates.

The agency has tentatively decided to define specific situations (i.e., when the protein hydrolysate used is an autolyzed yeast extract or a highly hydrolyzed protein hydrolysate) in which the label declaration of free glutamate formed during the production of protein hydrolysates is required.

The tentative decision to require declaration of glutamate as a component of certain protein hydrolysates is in response to information reviewed by the agency that suggests that the proposed common or usual name for protein hydrolysates used for flavor-related purposes does not accurately describe the basic nature or characterizing properties of the ingredient. Specifically, some protein hydrolysates with high levels of glutamate are

functionally equivalent to MSG when added to food, while other protein hydrolysates, added to food for nonflavor related purposes, contain inadequate levels of glutamate to mimic MSG in food.

Literature reviewed by the agency (Ref. 4) indicates that protein hydrolysates from different sources may contain very different levels of free glutamate based on the amino acid profile of the source protein and the degree of hydrolysis of the protein hydrolysate. These technical differences are important in deciding which protein hydrolysates will be used in which foods.

Two basic methods for producing protein hydrolysates used for flavor-related purposes were identified in the 1991 ingredient labeling proposal (56 FR 28592 at 28596): Acid hydrolysis and enzyme hydrolysis (including hydrolysis by endogenous proteolytic enzymes as occurs in the preparation of autolyzed yeast extract). The high degree of hydrolysis that occurs as a result of the acid digestion of the source protein results in a 75 to 95 percent free amino acid content. Enzyme hydrolysis, on the other hand, is less complete, and the resulting free amino acid content can be as little as 45 percent (Ref. 4).

The major contributors to the flavor and flavor enhancement properties of protein hydrolysates are the many amino acids and their derivatives (Ref. 4). Glutamic acid, although well-known for its flavor enhancing properties, is only one of several amino acids contributing to the desirable flavor profile of a hydrolyzed protein. Nevertheless, it is the predominant amino acid in all of the protein sources currently subjected to hydrolysis for flavor-related uses (i.e., autolyzed yeast extracts and highly hydrolyzed proteins) (Ref. 4). Furthermore, data show that, as the free glutamate component of the protein hydrolysate is increased, the effectiveness of the protein hydrolysate as a flavor enhancer is also increased (Refs. 4, 59, and 60). Moreover, the amount of free glutamate in protein hydrolysates commonly used for flavor-related purposes is at a level such that the glutamate is capable of functioning as a flavor enhancer independently of the protein hydrolysate (Refs. 4 and 60).

The concern expressed in the comments by consumers who desire to know whether a protein hydrolysate has a significant glutamate functionality, but are unable to determine the nature of the protein hydrolysate from the information in the ingredient list, led the agency to consider further current labeling practices as they relate to commonly used levels of highly hydrolyzed proteins and autolyzed yeast extracts. In addition, the comments the agency has received on the various types of protein hydrolysates used in foods (i.e., flavor and nonflavor types) and the consumer confusion that surrounds the current terms used to declare protein hydrolysates have convinced the agency that additional provisions for common or usual name declaration of flavor type protein hydrolysates are required in the regulations to ensure that the common or usual names accurately describe the nature and characterizing properties of these ingredients.

Under the declaration of ingredients final rule, for example, both a highly and a partially hydrolyzed soy protein may be declared as "hydrolyzed soy protein." This form of declaration provides no means of distinguishing between the lightly hydrolyzed ingredient, which does not contain a level of free glutamate sufficient to cause the ingredient to function as a flavor enhancer; and the highly hydrolyzed ingredient, which does contain functionally effective free glutamate. In order to ensure that the common or usual names of protein hydrolysates used for flavor-related purposes accurately describe the basic nature of the particular ingredient and its characterizing property distinction as required by § 102.5(a), the agency tentatively concludes that the common or usual names of protein hydrolysates used for flavor-related purposes (i.e., autolyzed yeast extracts and highly hydrolyzed proteins) should include the parenthetical phrase "contains glutamate." Highly hydrolyzed proteins can be defined as those with a ratio of α-amino nitrogen (AN) to total nitrogen (TN), determined by using the tests for "Acid Hydrolyzed Proteins" set forth in the "Food Chemicals Codex", 3d ed., 1st Supp. (1983), greater than 0.62 (AN:TN ≤ 0.62) (Ref. 53). Proteins that are not highly hydrolyzed would have an AN:TN ratio of less than 0.62 (AN:TN < 0.62) and may be declared by using such terms as "partially," "mildly," or "lightly" (e.g., "Partially hydrolyzed (source) protein"), as discussed in the declaration of ingredients final rule.

Thus, FDA is proposing to require declaration of glutamate in the common or usual names of highly hydrolyzed proteins and autolyzed yeast extracts because it is essential to describe accurately the basic nature and characterizing property of the particular ingredient. The agency is proposing to add new § 102.22(b) to include this requirement. For example, a common or usual name required by this proposed regulation would be "hydrolyzed soy protein (contains glutamate)" or "autolyzed yeast extract (contains glutamate)." The agency believes that this provision will provide fully informative labeling for hydrolyzed proteins used for flavor-related purposes. It will also preclude the misleading practice, alleged in many comments, of manufacturers using protein hydrolysates as substitutes for MSG in order to circumvent the requirement that MSG be declared in the ingredient list.

The agency requests comments on its tentative decision to require "contains glutamate" as part of the common or usual name of these protein hydrolysates.

C. Use of "and/or" Labeling

The food labeling regulations allow the use of "and/or" labeling in certain situations when manufacturers are unable to adhere to a consistent pattern of use of specific ingredients in their products (§ 101.4(b)). Such labeling provides a manufacturer with the flexibility to list together in the ingredient list of a food product all the ingredients of a particular type (e.g., fats or oils) that it sometimes uses to make the product, without having to specify the ingredients that are actually present in the product. To make clear that not all of the ingredients identified are actually present, the entry in the ingredient list must include the words "or," "and/or," or "contains one or more of the following."

In the 1991 ingredient labeling proposal, the agency denied the citizen petition of the National Soft Drink Association (NSDA) (January 20, 1984—Docket No. 84P–0029) that had requested that FDA allow for the use of "and/or" labeling for sweeteners in soft drinks.

NSDA submitted a comment and additional information requesting that FDA reconsider its denial of its petition and provide for the use of "and/or" labeling for sweeteners in soft drinks. These comments maintained that the option of using different sweetener formulations (e.g., sucrose, high fructose corn syrup (HFCS), or a blend of the two), in conjunction with meeting consumer demands during peak selling periods, obtaining product labels from a national supplier, and the huge sales volume of the bottler system, necessitates the flexibility of an "and/or" labeling system. These comments asserted that, in contrast to sweeteners used in other foods, sugar and HFCS are used in soft drinks exclusively to produce desired sweetness. Furthermore, in contrast to other foods, nondiet soft drinks contain only these

two sweeteners. A single intense (i.e., artificial) sweetener is used solely in diet soft drinks. The comments did not request inclusion of intense sweeteners in "and/or" labeling. They stated that HFCS and sugar are completely interchangeable in soft drinks. One sweetener can be substituted for the other without otherwise altering the formulation or changing the order of predominance of the total amount of the two sweeteners in the ingredient label. The comments reported that, consequently, a current practice in the soft drink industry is for different bottlers of the same brand of soft drink to use different sweetener formulations (i.e., either HFCS, sugar, or a blend of HFCS and sugar) when HFCS, the primary sweetener used, is in short supply for the bottler.

Furthermore, the comments reported that the franchise company typically provides "standard copy" labels to all of the bottlers of a particular brand of soft drink. This practice ensures consistency, uniformity, and accuracy for all of a company's product labels throughout the nation. The comments asserted that because the franchise company provides labels to the bottlers, each individual bottler does not have the flexibility of using labels specific to its unique formulation of HFCS, sugar, or an HFCS-sugar blend. Without "and/or" labeling, problems with compliance may arise when these bottlers need to change their labels in response to necessary adjustments in their specific sweetener formulations. The comments contended that, furthermore, without the flexibility of "and/or" labeling, many bottlers would be forced to maintain, at a minimum, dual inventories of packages (for soft drinks packaged in cans, the label is printed on the can during can manufacture) and labels, which could not only double or triple their operating cost but also make it unlikely that soft drink can manufacturers which, commonly, already operate at 97 percent of capacity would be able to meet the demand for additional packaging.

These comments stated that even though problems of availability of HFCS do not occur routinely, situations do arise from time to time every year in many different parts of the country that necessitate altering the sweetener formulation or completely substituting sugar for HFCS. The comments stated that the demand for soft drinks is seasonal, and that there is not enough flexibility in the supply system to accommodate spot shortages of HFCS during peak demand season. They stated that there were limits to the ability to stockpile HFCS in anticipation of shortages. The storage life of HFCS is only 90 to 120 days. After that period of time, it changes color, decreases in sweetness, and is not suitable for use. Without "and/or" labeling, the flexibility of using sugar to compensate for shortages in HFCS would be lost unless multiple inventories of labels were maintained.

These comments further stated that "and/or" labeling would allow certain soft drink manufacturers to use "kosher for Passover" claims on shrink wrap, bottle lids and caps, or cardboard enclosures, without changing the ingredient label, to indicate to the consumer that the product has been sweetened with sugar rather than HFCS and meets kosher requirements. Without "and/or" labeling, bottlers wishing to market kosher soft drinks would have to obtain completely new packaging, listing only sugar in the ingredient list. The comments contended that the considerable expense associated with maintaining different packaging in order to offer a product in conformity with religious requirements would discourage bottlers from producing such products.

The comments strongly urged FDA to reconsider its position and to allow the use of "and/or" labeling of sweeteners in soft drinks.

At the time that the agency developed the ingredient labeling proposal, it was"not aware that sweetener formulations may be different for the same soft drink brand. In light of this information, FDA has reconsidered its denial of NSDA's petition on the use of "and/or" labeling for sweeteners in soft drinks. Based on its reconsideration, FDA finds substantial merit on both sides of this issue.

The petition and comments allege that a constant pattern of use of sweeteners does not exist among soft drink bottlers because individual bottlers are sometimes required to change their sweetener formulation in response to shortages in supply. FDA finds, however, that this reason does not justify establishing a provision for "and/or"labeling. The agency has traditionally dealt with such emerging shortages by informally granting temporary labeling exceptions to the manufacturers. This approach fully addresses this aspect of the problem.

The second basis for "and/or" labeling that the petition and comments assert is that different bottlers around the country use different formulas. As a result, the labels for some would need to list only HFCS in the ingredient list, the labels for others HFCS and sugar. Moreover, at Passover, a third label would be required that lists only sugar. Having to prepare and maintain three labels would add to the costs of the franchise company and would limit its ability to ensure the consistency and uniformity of its product labels throughout the nation. The individual bottlers would have the costs of maintaining a label that reflects their regular formula plus the Passover label. Thus, the question that the agency must consider is whether the additional costs to the franchise company and bottler make it impracticable for soft drinks to satisfy section 403(i)(2) of the act (21 U.S.C. 343(i)(2)) and to declare each ingredient by its common or usual name.

Granting an exemption for sweeteners in soft drinks would represent a significant departure from the circumstances in which FDA has granted "and/or" exemptions in the past. FDA has only granted "and/or" exemptions when the manufacturer has been unable to adhere to a constant pattern of ingredient use. As explained above, FDA questions whether the claim has credibly been made here. Moreover, all "and/or" labeling exemptions in § 101.4(b) have been for minor ingredients, such as leavening agents, yeast nutrients, dough conditioners, firming agents, and ingredients that are less than 2 percent of the foods. Furthermore, such "and/or" labeling exemptions are provided for these ingredients in all foods and is not restricted to a specific food type. Thus, FDA has significant concerns about the precedent that it would create by granting this exemption.

However, in the interests of advancing the administrative process in the most expeditious manner, FDA is proposing to grant the exemption. The agency is proposing to add § 101.4(b)(21) to allow the use of "and/or" labeling for sweeteners in soft drinks.

The agency wishes to make clear, however, that its final decision on the exemption will be based largely on the comments that it receives. To justify adoption of proposed § 101.4(b)(21), industry will have to produce data to demonstrate that it is in fact impracticable to produce the very limited number of versions of a label that would be necessary if an exemption is not granted. Those who oppose granting the exemptions will have to come forward with strong reasons why the requested exemption should not be granted in the face of data from the industry that establishes significant costs from strict compliance with section 403(i)(2) of the act. Is there data to show, for example, that consumers are less willing to buy a product that contains HFCS than sugar? Is there

reason to believe that the use of "and/or" labeling in this instance is to obscure the nature of the sweetener used rather than to minimize labeling costs? FDA will consider the comments that it receives.

III. Economic Impact

In its food labeling proposals of November 27, 1991 (56 FR 60366 et seq.), FDA stated that the food labeling reform initiative, taken as a whole, would have associated costs in excess of the $100 million threshold that defines a major rule. Thus, in accordance with Executive Order 12291 and the Regulatory Flexibility Act (Pub. L. 96–354), FDA developed one comprehensive regulatory impact analysis (RIA) that presented the costs and benefits of all of the food labeling provisions taken together. That RIA was published in the Federal Register of November 27, 1991 (56 FR 60856), and along with the food labeling proposals, the agency requested comments on the RIA.

FDA has evaluated more than 300 comments that it received in response to the November 1991 RIA. FDA's discussion of these comments is contained in the agency's final RIA published elsewhere in this issue of the Federal Register. In addition, FDA will prepare a final regulatory flexibility analysis (RFA) subsequent to the publication of the food labeling final rules. The final RFA will be placed on file with the Dockets Management Branch (address above) and a notice will be published in the Federal Register announcing its availability.

In the final RIA, FDA has concluded, based on its review of available data and comments, that the overall food labeling reform initiative constitutes a major rule as defined by Executive Order 12291. Further, the agency has concluded that although the costs of complying with the new food labeling requirements are substantial, such costs are outweighed by the public health benefits that will be realized through the use of improved nutrition information provided by food labeling.

Because any changes that result from this proposal will not need to be made until the same date as the other changes required by the other rulemakings undertaken in response to the 1990 amendments (May 8, 1994), this proposal will not add any additional costs to those considered in the RIA.

IV. Environmental Impact

The agency has previously considered, in the 1991 ingredient labeling proposal, the environmental effects of the type of action being taken in this proposed rule. No new information or comments have been received that would affect the agency's previous determination under 21 CFR 25.24(a)(8) and (a)(11) that there is no significant impact on the human environment and that an environmental impact statement is not required.

V. Effective Date

The proposed effective date of any final rule based on this proposal is May 8, 1994. FDA intends to publish the final rule on this proposal as soon as possible after the comment period to ensure that any labeling changes necessitated by the final rule can be accomplished by the proposed effective date.

VII. Comments

Interested persons may, on or before March 8, 1993, submit to the Dockets Management Branch (address above) written comments regarding this proposal. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

List of Subjects

21 CFR Part 101

Food labeling, Reporting and recordkeeping requirements.

21 CFR Part 102

Beverages, Food grades and standards, Food labeling, Frozen foods, Fruit juices, Oils and fats, Onions, Potatoes, Seafood.

21 CFR Part 161

Food grades and standards, Frozen foods, Seafood.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR parts 101, 102, and 161 are amended as follows:

PART 101—FOOD LABELING

1. The authority citation for 21 CFR part 101 continues to read as follows:

Authority: Secs. 4, 5, 6 of the Fair Packaging and Labeling Act (15 U.S.C. 1453, 1454, 1455); secs. 201, 301, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 342, 343, 348, 371).

2. Section 101.4 is amended by adding new paragraph (b)(21) to read as follows:

§ 101.4 Food; designation of ingredients.

* * * * *

(b) * * *

(21) Each individual sweetener in a soft drink (soda) shall be declared by its specific common or usual name in its order of predominance in the soft drink (soda) except that, if the manufacturer is unable to adhere to a constant pattern of nutritive sweeteners in the soft drink (soda), the nutritive sweeteners may be designated in their order of predominance in the soft drink (soda) by words indicating that the sweeteners may not be present, such as "and/or," "or," or "contains one or more of the following:".

* * * * *

PART 102—COMMON OR USUAL NAME FOR NONSTANDARDIZED FOODS

7. The authority citation for 21 CFR part 102 continues to read as follows:

Authority: Secs. 201, 403, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 343, 371).

8. Section 102.22 is amended by adding new paragraph (b) to read as follows:

§ 102.22 Protein hydrolysates.

* * * * *

(b) The parenthetical declaration "(contains glutamate)" when the protein hydrolysate is an autolyzed yeast extract, or a highly hydrolyzed protein (i.e., hydrolyzed proteins whose ratio of α-amino nitrogen (AN) to total nitrogen (TN), using the tests for "Acid Hydrolyzed Proteins" set forth in the "Food Chemicals Codex", 3d ed., First Supp. (1983), is greater than 0.62). "Hydrolyzed soy protein (contains glutamate)" or "autolyzed yeast extract (contains glutamate)" are examples of acceptable names.

PART 161—FISH AND SHELLFISH

9. The authority citation for 21 CFR part 161 continues to read as follows:

Authority: Secs. 201, 401, 403, 409, 701, 706 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 341, 343, 348, 371, 376).

10. Section 161.190 is amended by adding two sentences to the end of paragraph (a)(8)(vi) to read as follows:

§ 161.190 Canned tuna.

(a) * * *

(8) * * *

(vi) * * * If the vegetable extractives used in manufacturing the vegetable broth include extractives of soybeans, the designation of vegetable broth in the ingredient statement shall be followed by a parenthetical listing as follows: "vegetable broth (includes soybeans)." Alternatively, if vegetable broth containing soybean extractives serves as a flavor and has no flavor enhancing function, it may be listed in the ingredient statement as: "flavoring (includes soybeans)."

* * * * *

Dated: October 26, 1992.

David A. Kessler,

Commissioner of Food and Drugs.

Louis W. Sullivan,

Secretary of Health and Human Services.

BILLING CODE 4160-01-F

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 100

[Docket No. 92N–0383]

Misleading Containers; Nonfunctional Slack-Fill

AGENCY: Food and Drug Administration, HHS.

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA), in accordance with the Nutrition Labeling and Education Act of 1990 (the 1990 amendments), is proposing to amend its regulations to define the circumstances in which a food is misbranded under section 403(d) of the Federal Food, Drug, and Cosmetic Act (the act). Among other things, the proposed regulation defines the circumstances in which the slack-fill within a package is nonfunctional and, therefore, misleading. FDA is taking this action to remedy the inadequate implementation of section 403(d) of the act.

DATES: Written comments by March 8, 1993. The agency intends to issue a final rule by May 8, 1993.

ADDRESSES: Written comments may be sent to the Dockets Management Branch (HFA–305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Michelle A. Smith, Center for Food Safety and Applied Nutrition (HFS–158), Food and Drug Administration, 200 C St. SW., Washington, DC 20204, 202–205–5106.

SUPPLEMENTARY INFORMATION:

I. Background

A. Section 403(d) of the Act

Section 403 of the act (21 U.S.C. 343) defines conditions under which a food is deemed to be misbranded. Section 403(d) of the act deals with misleading containers. This section states that a food is misbranded "if its container is so made, formed, or filled as to be misleading." The misleading container provisions in section 403(d) of the act may be triggered by misleading packaging practices, misleading containers themselves, or by misleading fill. Examples of packaging and filling practices that would cause a food to be misbranded under section 403(d) of the act include: (1) Packages made of yellow cellophane that make plain or water noodles appear to be rich in egg; (2) containers formed with a false bottom, ridges, or other device whose sole purpose is to create empty space (i.e., space devoid of product) within a container; and (3) opaque packages filled to substantially less than capacity, i.e., packages containing an unnecessary amount of empty space (slack-fill) that is significant in proportion to the volume of the container, and that consumers may not be aware of when they purchase the product. The first two examples refer to containers that are "made" or "formed" as to mislead consumers regarding the quality or quantity of the contents of such container (hereinafter referred to as "deceptive packaging"). The third example refers to deceptive fill even though the net quantity of contents may be accurately stated.

B. The 1990 Amendments

The 1990 amendments (Pub. L. 101–535) provide, among other things, for the Federal preemption of certain food standards and other labeling requirements issued by a State or political subdivision of a State. Section 6 of the 1990 amendments, entitled "National Uniform Nutrition Labeling," adds new section 403A to the act (21 U.S.C. 343–1). Section 403A(a)(3) of the act prohibits States from directly or indirectly establishing any requirement for the labeling or packaging of any food in interstate commerce of the type required by sections 403(b) (offered for sale under the name of another food), 403(d) (misleading container), 403(f) (appropriate prominence of information), 403(h) (standards of quality and fill), 403(i)(1) (common or usual name), or 403(k) (declaration of artificial flavoring, coloring, or preservatives) of the act that is not identical to the requirement of such section. However, sections 6(b)(3) and 10(b)(1)(C) of the 1990 amendments provide that the six provisions listed in section 403A(a)(3) of the act do not become preemptive until FDA determines that each is being adequately implemented by Federal regulations.

To implement section 403A of the act, section 6(b) of the 1990 amendments mandates that the Secretary of Health and Human Services (the Secretary) (and, by delegation, FDA) contract for a study to determine whether the above six misbranding sections of section 403 of the act are adequately being implemented by Federal regulations. The 1990 amendments further mandate that FDA publish in the Federal Register lists of sections that are (or are not) being adequately implemented by Federal regulations. Finally, the 1990 amendments require that FDA propose revisions to its regulations for any sections that the agency determines are not being adequately implemented.

C. The IOM Report

In accordance with section 6(b) of the 1990 amendments, FDA entered into a contract with the National Academy of Sciences, Institute of Medicine, Food and Nutrition Board (hereinafter referred to as "the IOM") to conduct a study of State and local food labeling and packaging requirements of the types required by section 403(b), (d), (f), (h), (i)(1), and (k) of the act and to report on whether these sections of the act, and the regulations issued by FDA to enforce them, adequately implement the purposes of such sections. On April 23, 1992, the IOM submitted to FDA the final draft manuscript reporting its findings. A copy of the report, entitled "Food Labeling: Toward National Uniformity" (hereinafter referred to as "the IOM report"), is on file with the Dockets Management Branch (address above) under the above-referenced docket number. Copies of the IOM report may be purchased from the National Academy Press, 2101 Constitution Ave. NW., Washington, DC 20418.

Based on information collected at a public meeting (May 8, 1991), written comments to the public meeting notice, and discussions with State and local regulators, industry representatives, and consumer groups, the IOM reported that all but section 403(d) of the act (misleading container) are being adequately implemented.

The IOM report acknowledged that there was a wide divergence of views among State officials, industry, and consumer groups as to whether section 403(d) of the act is being adequately implemented. All groups that expressed an opinion to the IOM about the adequacy of implementation of 403(d) of the act felt very strongly about their position.

Industry generally supported the adequacy of implementation of 403(d) of the act. However, some State officials and consumer groups testified that the absence of Federal regulations and the small number of enforcement actions under section 403(d) of the act are evidence that this section is not being adequately implemented.

The IOM found that relatively few States have taken independent action to establish more specific requirements related to container fill or deceptive packaging. One State official testified that his State has not encountered problems with container fill and deceptive packaging, and that, if it did, section 403(d) of the act was more than adequate if enforced. Of the States with

regulations prohibiting misleading containers, two have adopted "formed or filled" language similar to section 403(d) of the act.

One State regulation cited by the IOM addresses variance from net weight which may be more relevant to section 403(e) than to 403(d) of the act. Another State regulation cited by the IOM deals with the practice of "downsizing," i.e., reducing the amount of product in a container without a substantial change in the size or shape of the container. For example, a manufacturer may decide (with an appropriate change in the declared net weight) to sell 14 ounces (oz) of coffee in a container similar in appearance to one that has traditionally held 16 oz of product. The potential problem with downsizing lies in the fact that consumers, familiar with a product and its packaging, may receive an amount of product that is less than they expect based on a history of purchases.

FDA notes that reducing the amount of product in a container without reducing the volume of the container will increase the amount of slack-fill in that container. To the extent that some portion of this slack-fill would be nonfunctional, the practice would constitute misleading fill under § 100.100, as proposed. However, proliferation of sizes, of which downsizing may be a part, comes under the jurisdiction of the Department of Commerce as provided for in section 5(d) of the Fair Packaging and Labeling Act (FPLA) (15 U.S.C. 1454). Therefore, the practice of downsizing is outside the scope of this proposed rulemaking, although the package that results is not.

Four States have chosen to issue regulations that establish specific fill-of-container provisions or that define misleading fill beyond the provisions of section 403(d) of the act. Several State officials provided the IOM with examples of packaged foods that are currently being marketed and that represent, in their view, objectionable practices that have occurred under FDA's current policies.

The IOM reported that there was disagreement among the members of the committee that it used to study about the adequacy of the implementation of 403(d) of the act. According to the IOM report, some members of the committee saw no problem with implementation of section 403(d) of the act and did not feel consumers were being disadvantaged by deceptive packaging or slack-filled containers. These members believed that the more blatant examples of misleading containers presented to the IOM could be addressed quite readily under current law. In addition, these members maintained that, because the IOM had determined that the level of enforcement activity was not a criterion in determining adequacy of implementation, new regulations should not be suggested to FDA on the basis of the level of enforcement of this section.

The IOM report stated that other committee members were impressed by the examples of packaging presented by State officials and believed that deceptive or slack-filled containers should be considered a matter of national importance. One example cited in the IOM report involved two varieties of a hot beverage mix in single-serving packages within an outer container. One variety was a "light" version of the regular mix. It contained 40 percent less product by weight but was packaged in the same size envelopes and external package as the regular mix. The IOM believed that packaging the "light" product in the same way as the regular product could potentially mislead consumers as to the quantity of food that they were purchasing. Ultimately, the IOM decided that the perception of inadequacy on the part of some State officials and consumer groups was sufficiently strong to justify a finding that section 403(d) of the act is not being adequately implemented.

D. Agency Determination of Adequacy of Implementation of Section 403(d) of the Act

In a document published in the **Federal Register** of July 28, 1992 (57 FR 33283), based on the IOM report, the agency proposed to find that of the six misbranding sections listed in section 403A(a)(3) of the act, all but section 403(d) are being adequately implemented. The document provided for the submission of comments by interested persons by September 28, 1992.

In a final rule published elsewhere in this issue of the **Federal Register**, the agency is announcing its conclusion, based on comments submitted in response to the July 28, 1992, proposal and other relevant material, that all but section 403(d) of the act are being adequately implemented. The agency notes that three of the six letters received in response to the July 28, 1992, proposal maintained that section 403(d) of the act is being adequately implemented. However, as discussed in the final rule, none of the comments provided a factual basis to support a determination that 403(d) of the act is being adequately implemented.

In its consideration of whether section 403(d) of the act is (or is not) being adequately implemented, the agency gave significant weight to evidence cited by the IOM that a number of States have addressed fill-of-container matters that are not addressed by FDA's regulations. As discussed in the final rule, FDA believes that a strong Federal regulatory system is a prerequisite of the Congressional mandate for uniformity. FDA currently has no regulations to implement the provisions of section 403(d) of the act. The agency determination that section 403(d) of the act is not being adequately implemented is discussed further in the final rule.

FDA acknowledges the lack of consensus expressed in the IOM report with respect to section 403(d) of the act (see section I.C. of this document) and in the comments to the proposed list. The agency is also concerned that, because of the time constraints imposed by the 1990 amendments, there may not have been sufficient time for interested parties to fully develop evidence to support a determination that section 403(d) is being adequately implemented.

FDA advises that, should it receive evidence during the comment period on this proposal that establishes that section 403(d) is being adequately implemented, the agency would be willing to reconsider its contrary determination. Thus, one possible outcome of this rulemaking would be a determination that section 403(d) is adequately being implemented by FDA and is thus preemptive, even in the absence of a new regulation. However, absent information to support such a finding, FDA advises that it tentatively concludes that the regulation proposed in this document would ensure adequate implementation of section 403(d) of the act.

II. The Issue of Slack-Fill

A. Introduction—The IOM Report

Most of the discussion in the IOM report, and much of the information that the IOM received, regarding the adequacy of section 403(d) of the act centered around whether consumers are being adequately protected against slack-filled containers. Furthermore, of the States cited by the IOM that have established more specific requirements than section 403(d) of the act related to misleading containers, most have chosen to focus on misleading fill.

The IOM cited the California Sherman Food, Drug, and Cosmetic Law (California Health and Safety Code Section 26437) that adopted the language of section 5(c)(4) of the FPLA as an approach for prohibiting misleading fill. The IOM also stated that no single State regulation was adequate for adoption as a Federal standard. The IOM suggested that FDA consider

promulgating regulations to prohibit misleading fill based on the definition of nonfunctional slack-fill provided for in the FPLA. The IOM report concluded that the definition of nonfunctional slack-fill in the FPLA provides FDA with a means of implementing the intent of section 403(d) of the act and suggested that FDA consider promulgating regulations to prohibit misleading fill based on that definition. In concluding that section 403(d) of the act was not being adequately implemented, the IOM did not recommend that the agency promulgate regulations with regard to the deceptive packaging ("made" or "formed" as to be misleading) provisions of section 403(d) of the act.

B. Definition of "Slack-fill"

For the purposes of this rulemaking, "slack-fill" is defined as the difference between the actual capacity of a container and the volume of product contained therein. For example, when a round or cup-shaped candy bar is packaged in a square container, the empty space in the corners of the package is considered slack-fill. In the case of cereal or potato chips, the empty space external to the bulk of the product (i.e., at the top of the bag or box) would be considered slack-fill. Slack-fill includes space within a container that is empty of product but that may contain secondary packaging materials (e.g., bag-in-box packaging, cardboard dividers, or molded plastic trays).

Air space within the bulk of the food (e.g., the space between adjacent corn flakes, the "holes" in swiss cheese, or the air in whipped cream) is generally not considered to be slack-fill, although a portion of this space could become slack-fill as some products settle. The agency tentatively concludes that interstitial space in a food that results from the physical characteristics of the food (e.g., the shape of the food particles), that would be included in any common household measure of the food (e.g., a cup of sugar or a cup of corn flakes), and that cannot be excluded from the food without changing its physical characteristics is part of the body of the food rather than slack-fill. The agency believes that it is both inappropriate and impracticable to quantify as slack-fill the interstitial space that can not be separated from the bulk of a food without altering the character of the food. The agency invites comment on this interpretation.

C. The Fair Packaging and Labeling Act

The FPLA was promulgated, in part, to elaborate on and to reinforce the misbranding provisions in section 403 of the act. In section 2 of the FPLA (15 U.S.C. 1451), Congress clearly states that "Informed consumers are essential to the fair and efficient functioning of a free market economy. Packages and their labels should enable consumers to obtain accurate information as to the quantity of the contents and should facilitate value comparisons." Section 5(c)(4) of the FPLA provides for the promulgation of regulations necessary to prevent the deception of consumers or to facilitate value comparisons of consumer commodities, including regulations to prevent nonfunctional slack-fill. Section 5 of the FPLA states:

> For the purposes of paragraph (4) of this subsection, a package shall be deemed to be nonfunctionally slack-filled if it is filled to substantially less than its capacity for reasons other than (A) protection of the contents of such package or (B) the requirements of machines used for enclosing the contents in such package.

During 1970 and 1971, following enactment of the FPLA, FDA contracted with 11 State regulatory agencies to determine the extent to which slack-fill occurs in food packages at the retail level. Analysis of 11,000 samples revealed many packages with significant levels of slack-fill. In some instances, the empty space occupied as much as 80 percent of the volume of the container. However, this survey did not differentiate between functional and nonfunctional slack-fill.

The agency subsequently (from 1974 through 1976) initiated surveys at the manufacturing level to determine the extent to which slack-fill was justified by factors such as: Requirements of the filling machine, physical properties of the product, and normal product settling. These surveys focused on commodities that had: (1) Exhibited substantial slack-fill in the earlier State surveys, (2) significant production volumes, and (3) the highest incidence of consumer complaints. The commodities surveyed included: Candy, cookies, crackers, pretzels, potato chips, macaroni, spaghetti, cereal, dry dessert mixes, and prepared mixes.

Agency personnel, in cooperation with industry, observed various commercial manufacturing and filling operations and measured the degree to which product settled during shipping. They also collected data on variations in bulk density (weight per unit volume) for individual products and for product classes. In some instances (e.g., cereal and dry dessert mixes), FDA field personnel adjusted filling equipment or manually added additional product to containers in order to determine the effect of "overfill" on product quality. In other instances (e.g., a candy bar on a cardboard support with an outer wrap), the level of slack-fill was reduced by increasing the dimensions of the product. Overfilling packages to various degrees allowed FDA to identify the levels of slack-fill necessary for proper package closure and protection of the product and to determine the amounts of slack-fill that were likely to result from variations in the physical characteristics of the product and normal product settling. For the purposes of these studies, it was often easier to reduce slack-fill by increasing the fill of the container rather than altering the dimensions of the container.

Although the study was terminated before slack-fill had been fully studied in all the target commodities cited above, and no formal report was published, FDA collected sufficient data to determine that it is possible to distinguish between functional and nonfunctional slack-fill on a plant-by-plant basis for specific products in given container sizes.

At the same time, the agency noted that differences in the physical characteristics of a given product, including the need to protect the product from breakage, and precision of filling equipment result in a high degree of variability in the level of functional slack-fill within commodity classes. For example, functional slack-fill for macaroni products ranged from a low of 3.7 percent at manufacture and packaging to as much as 23.0 percent after shipping. Functional slack-fill levels for cereal products after shipping were even higher, ranging from 8.6 to 43.1 percent of the container volume. FDA concluded that many consumer commodities may have large levels of slack-fill that, although justified, might appear to be deceptive to consumers. FDA also observed that some products had greater slack-fill than could be justified by protection of the food or by requirements of the filling machine. A copy of the draft Compliance Program Evaluation for fiscal years 1975 and 1976 nonfunctional slack-fill surveys (7320.40 and 7320.65) is on file with the Dockets Management Branch (address above) under the above-referenced docket number.

The agency notes that some manufacturers employ label statements such as "Contents may settle during shipping" or "Contents sold by weight, not volume" to inform consumers that a package will probably appear to be less than full. Statements such as "A certain amount of air is packaged in each bag to act as a cushion against breakage" alert consumers as to the presence of slack-fill and provide

information on the function of the slack-fill.

Although section 5(c)(4) of the FPLA provides for the promulgation of regulations to prevent nonfunctional slack-fill in packages containing consumer commodities, FDA chose not to promulgate such regulations. Based on the preceding studies, FDA believed that establishing specific limits on the level of slack-fill of consumer commodities would, in many cases, involve values that were so high (e.g., as much as 63.8 percent for candy bars) that the regulations would serve no useful purpose. FDA also believed that such regulations could, in fact, encourage or legitimize a failure to minimize slack-fill on the part of some manufacturers. For example, a manufacturer with sophisticated equipment, capable of producing a product with a relatively low level of slack-fill, might decide to increase slack-fill in the product, taking advantage of a maximum slack-fill level that had been established based on less sophisticated packaging equipment. The agency also concluded that determining maximum allowable levels for functional slack-fill on a commodity-by-commodity basis would require considerable agency resources. Based on the preceding studies, FDA determined that it would not be appropriate to expend limited agency resources to develop regulations that would probably contribute little to improve implementation of section 403(d) of the act.

However, as stated above, the 1990 amendments require FDA to promulgate regulations to implement any provision listed in section 403A(a)(3) of the act that it determines is not being adequately implemented. Thus, in light of its determination that section 403(d) of the act is not being adequately implemented (see I.D. of this document), FDA has reconsidered its position on the need for regulations on nonfunctional slack-fill.

III. FDA Proposed Response

A. Introduction

As mentioned in section I.D. of this document, FDA has determined that section 403(d) of the act is not being adequately implemented. That section states that a food is misbranded if its container is so made, formed, or filled as to be misleading. Although FDA is addressing each of these aspects of section 403(d) of the act in proposed § 100.100, this rulemaking is primarily concerned with defining the circumstances in which the slack-fill within a package is nonfunctional and, therefore, constitutes misleading fill. The agency has tentatively decided not to elaborate on ways in which a container may be "made" or "formed" as to be misleading. The agency has tentatively concluded that these terms are straightforward and thus require little elaboration. This approach is consistent with that of several States that have chosen to establish regulations prohibiting misleading containers by elaborating only on what constitutes misleading fill. Furthermore, the IOM did not point to any particular problems emanating from the "made" or "formed" aspects of 403(d) of the act, nor did it recommend that the agency promulgate regulations with regard to these provisions. The agency invites comment on its approach and on whether it is necessary to elaborate on when a container is so made or formed as to be misleading to fully implement section 403(d) of the act.

B. Misleading Fill

The agency has long been aware of consumer dissatisfaction with slack-filled containers. FDA advises that, in many products, a certain level of slack-fill has a functional purpose (e.g., protecting the product) and, therefore, can be justified even though some consumers may perceive it to be misleading. The agency acknowledges that some products being marketed under existing Federal regulations may contain amounts of slack-fill exceeding that necessary to protect the product or required by the filling machine. The agency also acknowledges that in the cases that it has brought to enforce section 403(d) of the act, such as the *United States* v. *174 Cases * * * Delson Thin Mints*, 195 F. Supp. 326 (D.N.J. 1961), aff'd 302 F.2d 724 (3d. Cir. 1962), the phrase "misleading fill" has proven to be too vague to permit successful resolution.

Although FDA has established fill-of-container standards for a number of standardized foods such as canned oysters (21 CFR 161.145) and canned wet pack shrimp in transparent or nontransparent containers (21 CFR 161.173), the agency believes that standards of fill are not a practical way to implement the intent of section 403(d) of the act for all consumer commodities. Establishing specific limits on the level of slack-fill on a commodity-by-commodity basis would require considerable agency resources, much more than the agency has available. On the other hand, FDA believes that the action suggested by the IOM, i.e., to establish by regulation a general definition for nonfunctional slack-fill using the FPLA for guidance, has merit.

FDA believes that by establishing under section 701(a) of the act (21 U.S.C. 371(a)) a regulation that implements section 403(d), it could provide a general definition for nonfunctional slack-fill that would serve to define the circumstances in which fill is misleading under the act. By doing so, the agency would provide the guidance about the meaning of misleading fill that was requested by State officials and consumer groups in testimony before the IOM. This approach would also allow enforcement based on the capabilities of individual processing and packaging facilities and on the specific physical properties (e.g., bulk density, uniformity, tendency to settle, and need for protection) of individual products, rather than establishing maximum slack-fill values for classes of commodities that are necessarily too high to have any meaning. The agency believes that this proposed action will: (1) Provide guidance for consumers and manufacturers regarding what is functional slack-fill and what is not, (2) encourage industry to evaluate the amount of slack-fill in existing products and aid it in choosing the most appropriate processing and packaging methods for new products, and (3) increase consumer confidence that the amount of slack-fill in consumer commodities has a function. By ensuring adequate implementation of section 403(d) of the act, the proposed regulation will reduce those instances of misleading fill that may exist under current Federal regulations.

FDA tentatively finds that appropriate levels of slack-fill are those no greater than necessary to accomplish the intended functional effect in the packaged food product. For example, a candy bar may be packaged so that it is resting on a cardboard support with both candy bar and support within an outer wrapper. The support will determine the minimum length and width of the outer packaging, while the height of the package is determined by the height of the candy bar. The dimensions of the cardboard support and the outer wrapper must be such as to accommodate normal variations in the size and shape of the product. The cardboard support needs to be of sufficient size and strength to protect the product during shipping and handling. It may also be necessary for the outer wrapper to be longer than the support, so that neither the support nor the candy bar interferes with the efficient closure of the outer wrapper.

When a candy bar is packaged in this manner, some slack-fill is inevitable. The amount of slack-fill in the package will vary depending on factors such as the uniformity of the product and the capabilities of the packaging equipment. The proposed regulation is not intended to require manufacturers who are operating under current good manufacturing practices to change the physical characteristics of a food, nor is it intended to require manufacturers to purchase more sophisticated packaging equipment (proposed § 100.100(a)(2)).

FDA tentatively finds that slack-fill or the practice that results in slack-fill is justified to the extent that it performs such appropriate functions as protecting the contents of the container or meeting the necessary requirements of the filling machine. Slack-fill in excess of that required to perform a function, e.g., using a 6-inch cardboard support to hold a candy bar that is 3 inches long, however, is nonfunctional slack-fill and, therefore, misleading fill, even though the support may continue to perform a function such as protecting the product.

To address this situation, FDA is proposing to define "nonfunctional slack-fill." The agency tentatively finds that the definition of this term that appears in section 5(c) of the FPLA is adequate to differentiate between functional and nonfunctional slack-fill of the types described above. However, slack-fill may serve additional purposes (e.g., allowing a package to accommodate tamper resistant devices or modified atmosphere packaging to extend shelf-life) that were not anticipated when the FPLA was enacted. FDA believes that slack-fill related to modified atmosphere or tamper resistant packaging is covered by that portion of the proposed definition that allows slack-fill to protect the contents of a container (proposed § 100.100(a)(1)).

FDA notes that some slack-fill, e.g., slack-fill resulting from normal product settling, does not perform a function in a food. As such, it could be considered nonfunctional slack-fill. However, product settling is a normal, unavoidable process for many types of food (e.g., cereal and potato chips). Thus, slack-fill that results from product settling is a function of the physical properties of the product (e.g., the shape of the pieces of food), and of the way in which the product is filled into the container (e.g., loosely packed). For the purposes of this proposed rule, FDA tentatively proposes to exclude unavoidable slack-fill that results from normal product settling from the definition of nonfunctional slack-fill (proposed § 100.100(a)(3)).

In addition, advances in food technology and product development have resulted in a number of products with slack-fill that may be justifiable (i.e., performs a specific function) but may not be addressed by the definition of nonfunctional slack-fill in the FPLA. For example, consumer demand for convenience has led to the development of food products that may be cooked in, or eaten out of, the containers in which they are purchased. Thus, packaging for an instant soup must not only allow efficient closure of the package and protect the product during shipping, it must also have sufficient empty space to hold the hot water added by the consumer to hydrate the product. A package of microwavable brownies may contain a disposable tray in which the product is both mixed and cooked. Thus, the package would need to be large enough to accommodate a tray whose size was based, in part, on the size of the cooked brownies, not the amount of dry mix in the container.

FDA notes that convenience foods often require an increase in the size of the container relative to the amount of product within the container. For example, a box containing hot chocolate in single serving packages is usually larger than a box containing the same amount of bulk product without the secondary packaging. In addition, such products would be clearly labeled as to their contents (e.g., "Contains 6 single-serve packages" or "Package contains baking tray"). Therefore, the agency tentatively concludes that reasonable levels of slack-fill resulting from the practices described above perform a function in that they are necessary for convenient preparation or consumption of the product. However, such functions are not covered by the definition of nonfunctional slack-fill in the FPLA. Therefore, the agency is proposing to exclude, from the definition of "nonfunctional slack-fill," slack-fill that results from practices that are necessary for a package to perform a particular function (e.g., to aid in the preparation and consumption of a specialty food product), where such function is clearly declared on the label and is an integral part of the nature of the food (proposed § 100.100(a)(4)).

Gift products represent another category where packaging may serve functions other than to simply contain and protect the food. For example, some gift products (e.g., cheese and jellies in a basket or assorted biscuits in a teapot) consist of a food contained in a reusable household article that is itself part of the gift. In some instances, the food component of the gift product is packaged in a predetermined or standardized quantity before being placed in the reusable gift container. At the same time, the size of the reusable gift container (e.g., a teapot) may be a function of its intended use after the food component of the gift has been consumed.

Depending on the nature of the food and the type of gift container used, manufacturers will have varying degrees of control over the amount of slack-fill in such containers. For example, baskets are available in a wide range of shapes and sizes, allowing manufacturers to choose a basket that is appropriate for the amount of food contained therein. Other household items that may be desirable gift containers (e.g., coffee cups or teapots) are available in a more limited number of sizes. Furthermore, because part of the purchase of a gift product is the continued utility of the reusable container, and part of the purchase may include intangibles (e.g., aesthetics or sentiment resulting from the way in which the product is packaged), it is more difficult to differentiate between functional and nonfunctional slack-fill in these items as compared to conventional foods.

FDA tentatively finds that, in the case of such gift products, reasonable differences between the volume of the reusable gift container and the amount of food contained therein that result from the role of the gift container in the presentation of the food would not constitute misleading fill, even though such slack-fill might not have a specific functional effect such as protecting the product. FDA tentatively finds that exempting reasonable amounts of slack-fill in such gift products (i.e., food packaged in a reusable household item) from the definition of nonfunctional slack-fill would provide manufacturers with flexibility in packaging such products, while providing consumers with product choices. The agency invites comment on these tentative findings. Specifically, FDA requests comment on the appropriateness of establishing an exemption from the definition of nonfunctional slack-fill for gift products consisting of a food item combined with a gift container (i.e., a reusable household item) where the gift container serves to contain and protect the food, is part of the presentation of the food, and is to be usable after the food is consumed (proposed § 100.100(a)(5)).

FDA advises that the preceding discussion is concerned only with gift products that are packaged in reusable containers. The agency acknowledges that other types of gift products may also be packaged in containers that are designed to do more than simply

contain and protect the food. For example, when candy is packaged in a heart-shaped box, the shape of the box conveys a message to the receiver. Other products, e.g., chocolate covered cherries, may be packaged in a decorative plastic tray that not only protects the product but plays a role in the presentation of the food. The agency believes that manufacturers of such products have greater control over package design and filling operations with respect to minimizing slack-fill in these products as opposed to gift products in a reusable container whose size and shape is, in part, a function of its intended use after the food has been consumed. The agency also notes that, in the absence of a reusable gift container, the distinction between gift products, luxury items, and conventional food products appears to be subjective. Furthermore, although packaging such as a heart shaped box appears to play a role in the presentation of a food, the agency lacks sufficient information to establish criteria for distinguishing between functional and nonfunctional slack-fill in such products.

The agency invites comment on whether it would be appropriate to provide more latitude in determining that slack-fill in gift products is functional if the slack-fill is attributable to packaging that serves to contain the food and that plays a role in the presentation of the food but that is not intended for reuse after the food is consumed. The agency invites comment on criteria that it could use to distinguish between functional and nonfunctional slack-fill in such products and for such purposes. Comments should provide specific examples of products whose packaging includes slack-fill associated with the presentation of a food that should, or should not, be excluded from the definition of nonfunctional slack-fill as misleading fill. Comments should provide substantive arguments for or against such an exclusion and, if appropriate, contain criteria to be used in determining such exclusion.

FDA notes that product reformulations may change the density, weight, or volume of a product, sometimes drastically. For example, a package of gelatin mix sweetened with sugar may contain 3 oz of product. The same product sweetened with a high intensity sweetener may weigh only 0.5 oz. If the manufacturer uses the same package for both products, the package containing gelatin sweetened with the high intensity sweetener will contain a significantly greater amount of slack-fill. The agency notes that the increased slack-fill in the package containing 0.5 oz of product exceeds the amount of slack-fill that is required to perform such necessary functions as protecting the product and ensuring proper package closure in the package that contains 3 oz of product. At the same time, the agency notes that both packages of gelatin contain sufficient mix to provide the same amount of finished product. The agency tentatively concludes that, absent a functional effect, the portion of slack-fill within a container resulting from product reformulation (e.g., removal of a macronutrient such as sucrose) that reduces the volume of product in that container constitutes nonfunctional (misleading) slack-fill. The agency invites comment on this tentative conclusion and on the criteria that could be used to distinguish between functional (justifiable) and nonfunctional (misleading) slack-fill in a case such as this.

The agency also invites comment on the appropriateness of establishing an exemption from the definition of nonfunctional slack-fill for packages containing slack-fill that results from an inability to further reduce the size of the package. The agency notes that some food products (e.g., saffron and saccharin) are frequently sold in very small quantities for various reasons, including: Limited shelf-life, high cost per unit volume, or the need to use only a small amount of the product at any one time. To the extent that such foods must be sold in a package of some minimum size to accommodate required food labeling excluding any vignettes or other nonmandatory designs or label information, discourage pilfering, or facilitate handling, the resulting slack-fill may be a function of a minimum package size requirement. Comments on the need for an exemption for such packages should present specific examples of products that have a minimum package size requirement and whose packaging includes slack-fill that should, or should not, be excluded from the proposed definition of nonfunctional slack-fill. Comments should provide substantive arguments for or against such an exclusion and, if appropriate, contain criteria to be used in determining such an exclusion.

The agency invites comment on any other practices or developments that may result in slack-fill and that are not addressed by the language of the proposed definition of nonfunctional slack-fill. Comments should provide specific examples of containers that represent functional slack-fill versus nonfunctional slack-fill or misleading fill. When appropriate, comments should also include suggested wording to be used in this rulemaking to ensure that the examples are adequately covered by any regulation that FDA adopts. The agency also invites comment on the phrase "filled to substantially less than capacity" in proposed § 100.100(a). FDA intends this phrase to mean that any packages containing levels of nonfunctional slack-fill that are significant in proportion to the volume of the container would be misbranded. FDA requests comment on the appropriateness of this standard. The agency also requests comment on how to define "significant" in this context.

Finally, the agency invites comment on whether it makes a difference if a product is packaged in a container that allows consumers to fully view the contents of the container. Specifically, would nonfunctional slack-fill be misleading when consumers can clearly see what they are purchasing?

The agency believes that several factors, such as the cost of packaging materials, space required for storage and transport, and increased national interest in efficient packaging to reduce solid waste, will serve to reduce slack-fill in many commodities.

The agency believes that the proposed regulation will ensure adequate implementation of section 403(d) of the act, thereby, providing additional consumer protection against misleading fill and facilitating value comparisons on the part of consumers. Thus, section 403(d) of the act will become preemptive upon adoption of proposed § 100.100. This regulation, if adopted, will also provide State regulatory agencies, as well as FDA, with a uniform means of taking action against misleading containers. The agency also notes that section 4 of the 1990 amendments (21 U.S.C. 337) provides for State enforcement of section 403(d) of the act in Federal court. Consequently, manufacturers can expect that packaging will be treated uniformly throughout the States with regard to misleading containers.

Therefore, FDA is proposing § 100.100 *Misleading containers* in part 100 (21 CFR part 100) within a newly proposed subpart of part 100 to be entitled "Subpart F—Misbranding for Reasons Other Than Labeling." The proposed regulation states that food is misbranded if its container is so made, formed, or filled as to be misleading. It defines misleading fill as nonfunctional slack-fill. Finally, the proposed regulation includes criteria for use in determining whether slack-fill is functional versus nonfunctional.

IV. Environmental Impact

The agency has determined under 21 CFR 25.24(a)(11) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Although not a labeling requirement per se, this action is closely related to food labeling and arises out of the misbranding sections of the act. In all other respects, this action comes within the exemption in § 25.24(a)(11). Moreover, although this action is not specifically designated in 21 CFR 25.22(a) and does not fall within the scope of the general provision (21 CFR 25.22(a)(19)), it could not significantly affect the quality of the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

V. Economic Impact

FDA has examined the economic implications of the proposed rule on misleading containers and nonfunctional slack-fill as required by Executive Orders 12291 and 12612 and the Regulatory Flexibility Act. Executive Order 12291 compels agencies to use cost-benefit analysis when making decisions, and Executive Order 12612 requires Federal agencies to ensure that Federal solutions, rather than State or local solutions, are necessary. The Regulatory Flexibility Act requires regulatory relief for small businesses where feasible. The agency finds that this proposed rule is not a major rule as defined by Executive Order 12291. In accordance with the Regulatory Flexibility Act (Pub. L. 96–354), FDA has also determined that this proposed rule will not have a significant adverse impact on a substantial number of small businesses. Finally, any federalism issues that would require an analysis under Executive Order 12612 are resolved as a matter of law by section 6 of the 1990 Amendments.

A. Market Failure

FDA believes the current proposal cannot be justified on the grounds of market failure. Required net weight figures already provide information on package contents. Furthermore, if consumers object to the level of slack-fill in a given package, they can easily identify that product by brand name and refrain from purchasing that particular product in the future. However, FDA believes that the IOM report and comments on whether section 403(d) of the act is being adequately implemented establish that a situation in which rulemaking is required under section 6 of the 1990 amendments exists.

There are three primary alternatives available to FDA with respect to ensuring adequate implementation of section 403(d) of the act.

(1) Adopt a regulation that does not define nonfunctional slack-fill but only repeats the language of section 403(d) of the act.

(2) Define nonfunctional slack-fill as proposed, with possible additional exemptions such as the following: (a) Gift products in nonreusable containers, (b) new products, initially introduced, where appropriate packaging material and equipment are not already available, and (c) small businesses.

(3) Define not only misleading fill but also when a container has been made or formed to be misleading.

B. Costs

1. Repeat the language of section 403(d) of the act

This alternative serves as the benchmark for estimating the costs and benefits of the other alternatives; therefore, no costs or benefits will be estimated for this alternative.

2. Define nonfunctional slack-fill as proposed, with possible additional exemptions

Potential compliance costs to industry include designing and manufacturing new packages. FDA currently has no information on the number of firms that would be affected or on the cost, if any, of required package changes. FDA requests information on compliance costs to firms resulting from this alternative beyond the costs that would occur if FDA promulgates a regulation that repeats the language of section 403(d) of the act.

In addition, consumers may undergo a utility loss from a reduction in the variety of packages currently available. Although the utility loss per product is probably small, FDA believes this utility loss may be significant in the aggregate, compared to the utility loss from the reduction in the variety of packages that would occur if FDA promulgates a regulation that repeats the language of section 403(d) of the act. FDA requests information on consumer valuation of packaging variety.

This alternative includes a possible exemption for gift products in nonreusable containers. The cost of this alternative with this exemption is as above, less the compliance cost to manufacturers of these products and the utility loss to consumers from reducing the current level of variety in the packaging of these products. FDA cannot estimate this cost at this time because FDA has been unable to specify an operational definition of gift product. FDA requests comments on whether it would be appropriate to provide this exemption, on defining gift product, and on consumer dissatisfaction with the fill of these products.

This alternative also includes a possible temporary exemption for new products, initially marketed, where appropriate packaging material and equipment (that is, material and equipment that eliminate nonfunctional slack-fill) are not already available. The cost of this alternative with this exemption is as above, less the compliance cost to manufacturers of these products and the utility loss to consumers from the reduction in the current rate of introduction of new products onto the market. FDA cannot estimate this cost at this time and requests information on the effect of this proposal on the rate of introduction of new products onto the market in the absence of this exemption, and on consumer valuation of any change in the rate at which new products are introduced onto the market. FDA also requests information on whether it would be appropriate to provide this exemption.

In addition, this alternative includes a possible exemption for small businesses. Under the Regulatory Flexibility Act of 1990, FDA is required to consider relief for small businesses from regulation where feasible. The cost of this alternative with this exemption is as above, less the compliance cost to small businesses and the utility loss to consumers from a possible reduction in the competitiveness of small businesses. The fixed cost of developing and introducing new packaging and purchasing new packaging equipment is a significant cost for small businesses. In the absence of this exemption, small businesses will be less able to produce a wide variety of products and product sizes than large businesses. FDA cannot estimate this cost at this time. FDA requests information on the effect of this alternative on small business in the absence of a small business exemption. FDA also requests information on whether it would be appropriate to provide this exemption.

3. Define not only misleading fill but when a producthas been made or formed to be misleading

The costs of this alternative are identical in kind to the costs of defining nonfunctional slack-fill as proposed. FDA cannot estimate these costs without specifying the conditions under which a product has been made or formed to be misleading. However, since this alternative would place

additional restrictions on packaging beyond the restrictions that would occur if FDA promulgates a regulation that repeats the language of section 403(d) of the act or defines nonfunctional slack-fill as proposed, the compliance cost of this alternative will be greater than that of either of these other two alternatives. FDA requests comments on potential specifications of when a product is made or formed to be misleading, as well as on the costs of such specifications to industry, consumers, and society in general.

C. Benefits

1. Repeat the language of section 403(d) of the act

This alternative serves as the benchmark for estimating the costs and benefits of the other alternatives; therefore, no costs or benefits will be estimated for this alternative.

2. Define nonfunctional slack-fill as proposed, withpossible additional exemptions

Potential benefits of this alternative include a reduction in the incidence of differing interpretations of the language of section 403(d) of the act that might occur if FDA promulgated a regulation repeating the language of section 403(d). FDA cannot estimate this benefit at this time and requests information on the likely incidence and cost of differing interpretations of the language of section 403(d) of the act that might occur if FDA promulgated a regulation repeating the language of section 403(d).

Potential benefits of this alternative to consumers will result from the possible reduction in the incidence of consumer dissatisfaction with the fill of food containers. A certain amount of consumer dissatisfaction with slack-fill is likely to remain since the amount of slack-fill in general will continue to vary between packages of the same products (because of settling, product breakage, etc.), between different brands of the same product (because of different packaging technology and product characteristics), and between different products. FDA currently has no information on the level of consumer dissatisfaction with the fill of containers, or on the degree to which current consumer dissatisfaction concerns nonfunctional slack-fill rather than slack-fill in general. Thus, FDA cannot estimate this benefit at this time.

However, since consumers can identify offending packages by brand name and refrain from purchasing that product in the future (even when complaints of slack-fill cannot be addressed by current Federal or State law), it is unlikely that utility losses from this source are significant. The benefit to consumers from changes in the regulations addressing slack-fill should therefore be quite modest.

The benefit of this alternative with any of the three possible additional exemptions will be as above, less the value of the reduction in consumer dissatisfaction with the fill of the products covered in the exemptions. FDA cannot estimate the benefit of this alternative with the possible exemptions at this time and requests information on consumer dissatisfaction with the fill of the products specified in the possible exemptions.

3. Define not only misleading fill but when a productthas been made or formed to be misleading

The benefit of this alternative is a reduction in consumer dissatisfaction with the form or construction of packaging. FDA cannot estimate this benefit without specifying the conditions under which a product has been made or formed to be misleading beyond the current provisions of section 403(d) of the act. FDA requests comments on potential specifications of when a product is made or formed to be misleading, as well as on the benefits of such specifications to consumers.

D. Conclusion

In accordance with Executive Order 12291, the agency has analyzed the economic effects of this proposed rule and has determined that this rule, if promulgated, will not be a major rule as defined by that order.

In accordance with the Regulatory Flexibility Act, the agency has requested information that will allow the agency to consider a small business exemption. FDA requests information on the effect of this proposed rule on packaging costs of small businesses.

Finally, FDA requests information on any other economic functions slack-fill might fulfill other than facilitating the test marketing of new products and the preservation of packaging variety for gift products.

VI. Comments

Interested persons may on or before January 11, 1993, submit to the Dockets Management Branch (address above) written comments regarding this regulation. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. and 4 p.m., Monday through Friday.

List of Subjects in 21 CFR Part 100

Administrative practice and procedures, Food labeling, Foods.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, it is proposed that 21 CFR part 100 be amended as follows:

PART 100—GENERAL

1. The authority citation for 21 CFR part 100 continues to read as follows:

Authority Secs. 201, 301, 307, 402, 403, 409, 701 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321, 331, 337, 342, 343, 348, 371).

2. New subpart F, consisting of § 100.100, is added to read as follows:

Subpart F—Misbranding for Reasons Other Than Labeling

§ 100.100 Misleading containers.

In accordance with section 403(d) of the act, a food shall be deemed to be misbranded if its container is so made, formed, or filled as to be misleading.

(a) A container shall be considered to be filled as to be misleading if it contains nonfunctional slack-fill. "Slack-fill" is the difference between the actual capacity of a container and the volume of product contained therein. "Nonfunctional slack-fill" is the empty space in a package that is filled to substantially less than its capacity for reasons other than:

(1) Protection of the contents of the package;

(2) The requirements of the machines used for enclosing the contents in such package;

(3) Normal product settling during shipping and handling;

(4) The need for the package to perform a specific function (e.g., where packaging plays a role in the preparation or consumption of a food), where such function is inherent to the nature of the food and is clearly labeled; or

(5) The fact that the product is a gift product consisting of a food or foods combined with a reusable gift container, where the container is intended for further use after the food is consumed.

(b) [Reserved]

Dated: November 5, 1992.

David A. Kessler,

Commissioner of Food and Drugs.

Louis W. Sullivan,

Secretary of Health and Human Services.

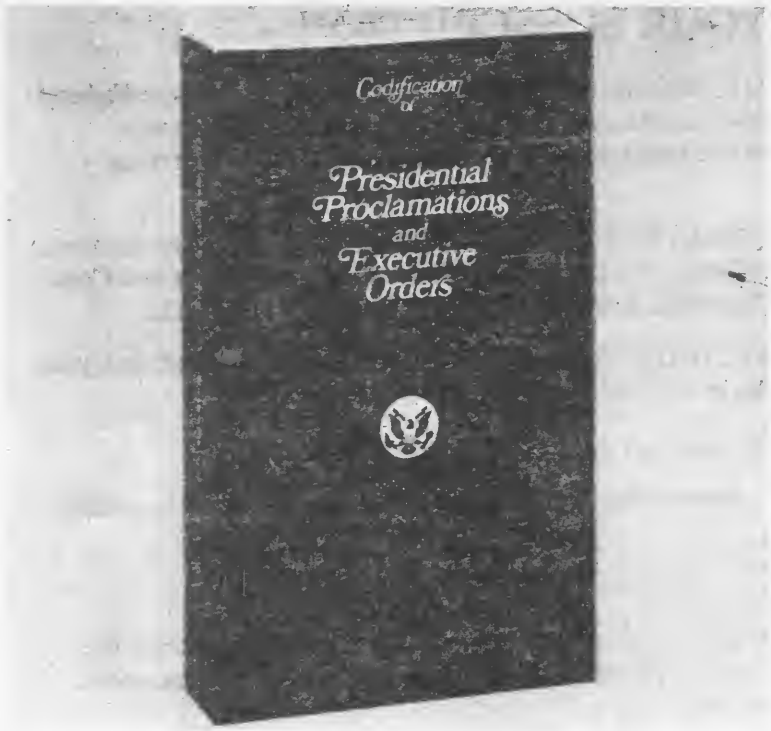
BILLING CODE 4160–01–F

.... Order now ! . . . .



For those of you who must keep informed about **Presidential Proclamations and Executive Orders,** there is a convenient reference source that will make researching these documents much easier.

Arranged by subject matter, this edition of the *Codification* contains proclamations and Executive orders that were issued or amended during the period April 13, 1945, through January 20, 1989, and which have a continuing effect on the public. For those documents that have been affected by other proclamations or Executive orders, the codified text presents the amended version. Therefore, a reader can use the *Codification* to determine the latest text of a document without having to "reconstruct" it through extensive research.

Special features include a comprehensive index and a table listing each proclamation and Executive order issued during the 1945–1989 period—along with any amendments—an indication of its current status, and, where applicable, its location in this volume.

FEDERAL REGISTER SUBSCRIBERS: IMPORTANT INFORMATION ABOUT YOUR SUBSCRIPTION

After 6 years without an adjustment, it has become necessary to increase the price of the **Federal Register** in order to begin recovering the actual costs of providing this subscription service. Effective October 1, 1992, the price for the **Federal Register** will increase and be offered as follows:

(1) **FEDERAL REGISTER COMPLETE SERVICE**—Each business day you can continue to receive the daily **Federal Register**, plus the monthly **Federal Register Index** and **Code of Federal Regulations List of Sections Affected (LSA)**, all for **$415.00** per year.

(2) **FEDERAL REGISTER DAILY ONLY SERVICE**—With this subscription service, you will receive the **Federal Register** every business day for **$375.00** per year.

HOW WILL THIS AFFECT YOUR CURRENT SUBSCRIPTION?

You will receive your current complete **Federal Register** service for the length of time remaining in your subscription.

AT RENEWAL TIME

At renewal time, to keep this important subscription coming—you can continue to receive the complete **Federal Register** service by simply renewing for the entire package, or you can select and order only the parts that suit your needs:

- renew your entire **Federal Register Service** (complete service)

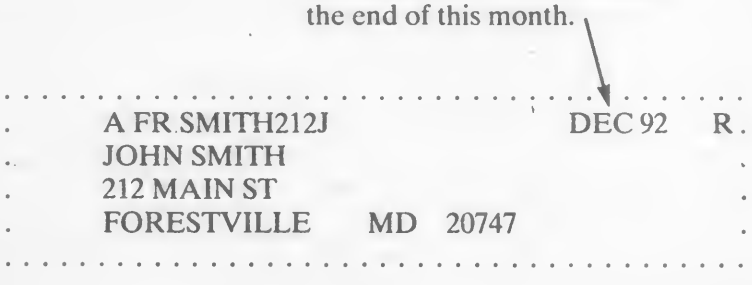
or select. . .

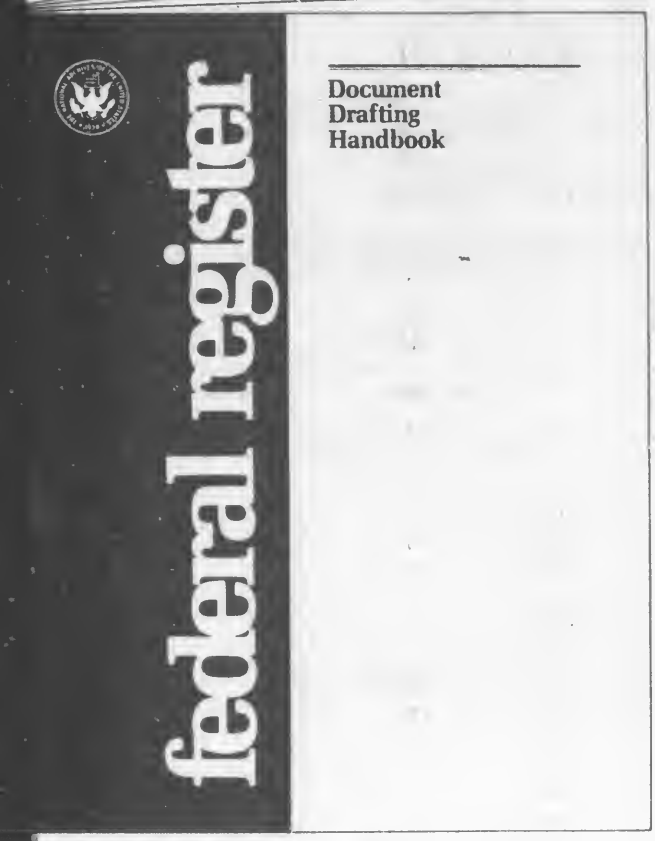
- the daily only **Federal Register** (basic service)
- and complement the basic service with either of the following supplements: the monthly **Federal Register Index** or the monthly **LSA**

When your current subscription expires, you will receive a renewal notice to continue the complete **Federal Register** service. At that time, you will also receive an order form for the daily **Federal Register** basic service, the **Federal Register Index**, and the **LSA**.

To know when to expect the renewal notice, check the top line of your subscription mailing label for the month and year of expiration as shown in this sample:

A renewal notice will be sent approximately 90 days before the end of this month.





Federal Register Document Drafting Handbook

A Handbook for Regulation Drafters

This handbook is designed to help Federal agencies prepare documents for publication in the Federal Register. The updated requirements in the handbook reflect recent changes in regulatory development procedures, document format, and printing technology.

Rev 6-92

Would you like to know...

if any changes have been made to the Code of Federal Regulations or what documents have been published in the Federal Register without reading the Federal Register every day? If so, you may wish to subscribe to the *LSA (List of CFR Sections Affected)*, the *Federal Register Index*, or both.

LSA • List of CFR Sections Affected

The LSA (List of CFR Sections Affected) is designed to lead users of the Code of Federal Regulations to amendatory actions published in the Federal Register. The LSA is issued monthly in cumulative form. Entries indicate the nature of the changes—such as revised, removed, or corrected. $21.00 per year

Federal Register Index

The index, covering the contents of the daily Federal Register, is issued monthly in cumulative form. Entries are carried primarily under the names of the issuing agencies. Significant subjects are carried as cross-references. $19.00 per year.

A finding aid is included in each publication which lists Federal Register page numbers with the date of publication in the Federal Register.

Note to FR Subscribers.
FR Indexes and the LSA (List of CFR Sections Affected) are mailed automatically to regular FR subscribers.
